Preface

This guide shows you how to install ForgeRock Access Management web server policy agents, as well as how to integrate with other access management software. Read the [Web Policy Agent Release Notes](#) before you get started.

This guide is written for anyone installing policy agents to interface with supported web servers application containers.

About ForgeRock Identity Platform™ Software

ForgeRock Identity Platform™ is the only offering for access management, identity management, user-managed access, directory services, and an identity gateway, designed and built as a single, unified platform.

The platform includes the following components that extend what is available in open source projects to provide fully featured, enterprise-ready software:

- ForgeRock Access Management (AM)
- ForgeRock Identity Management (IDM)
- ForgeRock Directory Services (DS)
- ForgeRock Identity Gateway (IG)

Chapter 1

Introducing Web Policy Agents

Web policy agents provide light touch integration for web applications running on supported web servers. This chapter covers what web policy agents do and how they work.

1.1. About Web Policy Agents

A *policy agent* enforces policy for AM and protects all resources on the web server. The policy agent intercepts requests from users trying to access a protected web resource and denies access until the user has authorization from AM to access the resource.

Note

A single policy agent installation can hold multiple policy agent instances. Therefore, install only one policy agent per web server and configure as many agent instances as you require.

Installing more than one policy agent in a web server is not supported.

1.1.1. Web Policy Agent Components

The web policy agent provides fast installation and light touch integration to protect the resources on the supported web server. The web agent consists of a web server plugin matching the API requirements of the particular web server and a native module that interfaces with AM for its services.

Figure 1.1. Web Policy Agent

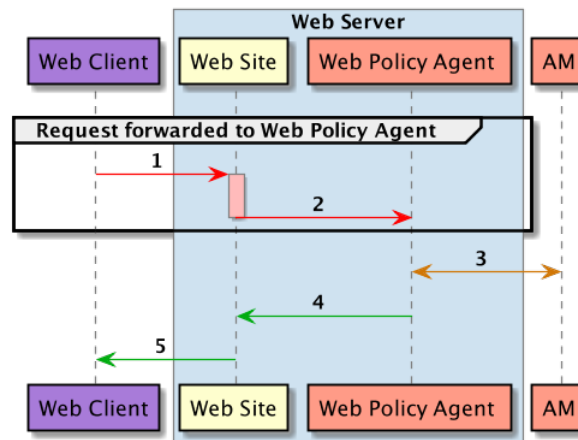

1.1.2. How the User, Web Policy Agent, and Access Management Interact

Imagine that a user attempts to access a protected resource before having authenticated by pointing the user's browser to a web page. Assume that you have configured AM to protect the web page. Then, the web policy agent intercepting the user's browser's request finds no session token in the request, and so redirects the user's browser to the AM login page for authentication. After the user has successfully authenticated, AM sets a session token in a browser cookie, and redirects the browser back to the page the user tried to access initially.

When the user's browser reiterates the request, the policy agent again checks that the request has a session token, finds a session token this time, and validates the session token with AM. Given the valid session token, the policy agent gets a policy decision from AM concerning whether the user can access the page. If AM's Policy Service determines that the user is allowed to access the page, AM responds to the policy agent that access should be granted. The web policy agent then permits the web page to be returned to the user's browser.

The following diagram shows how the pieces fit together when a web client accesses a web page protected by a policy agent. This diagram is simplified to show only the essential principals rather than to describe every possible case.

Figure 1.2. Web Policy Agent Interaction

A web policy agent is a library installed in the web server and configured to be called by the web server when a client requests access to a protected resource in a web site. Here is how it works:

1. The web client requests access to a protected resource.
2. The web server runs the request through the policy agent that protects the resource according to AM policy. The policy agent acts to enforce policy, whereas the policy configuration and decisions are handled by AM.
3. The policy agent communicates with AM to get the policy decision to enforce.

4. For a resource to which AM approves access, the policy agent allows access.
5. The web server returns the requested access to the web client.

1.2. Web Policy Agent Features

The Web policy agent provides a number of additional features useful for your deployment, some of which are described below.

1.2.1. Multiple Sites and Virtual Host Support

Web policy agent instances can be configured to operate with multiple websites in IIS, and with multiple virtual hosts in Apache.

Each configuration instance is independent and has its own configuration file, debug logs, and audit logs. Each instance can connect to a different AM realm, or even different AM servers.

For more information, see [Section 3.4, "Installing Apache Web Policy Agents into a Virtual Host"](#) and [Section 4.3, "Installing IIS Web Policy Agents"](#).

1.2.2. Web Agent SSO Only Mode

The agent intercepts all inbound client requests to access a protected resource and processes the request based on a global configuration property, `com.sun.identity.agents.config.sso.only`. The configuration setting determines the mode of operation that should be carried out on the intercepted inbound request.

When `com.sun.identity.agents.config.sso.only` is `true`, the web policy agent only manages user authentication. The filter invokes the AM Authentication Service to verify the identity of the user. If the user's identity is verified, the user is issued a session token through AM's Session Service.

When `com.sun.identity.agents.config.sso.only` is `false`, which is the default, the web policy agents will also manage user authorization, by using the policy engine in AM.

For more information, see [Section 8.1.3, "Configuring Web Policy Agent SSO Properties"](#).

1.2.3. Not-Enforced URL and Client IP Lists

The policy agent supports properties to bypass authentication and grant immediate access to resources not requiring protection, such as images, stylesheets, or static HTML pages.

You can configure a Not-Enforced URL List using the `com.sun.identity.agents.config.notenforced.url` property that grants the user access to resources whose URLs match those in the list.

For example, you can set URL patterns with wildcards in the AM console using the following patterns:

```
/logout.html  
/images/*  
/css/*-  
/*.jsp?locale=*
```

For more information on wildcard usage, see [Specifying Resource Patterns with Wildcards](#).

The policy agent supports a Not-Enforced Client IP List, which specifies the client IP addresses that can be excluded from authentication and authorization. This property is useful to allow administrators access to the web site from a certain IP address or allow a search engine access to the web resources.

For finer control, you can configure a not-enforced policy that applies to requests to specified URLs, which also come from a list of specified IP addresses. See [Not Enforced URL from IP Processing Properties](#) (Not yet in the AM console) .

For more information on not-enforced lists, see [Section 8.1.2, "Configuring Web Policy Agent Application Properties"](#).

1.2.4. Attribute Fetch Modes

Web policy agents provide the capability to fetch and inject user information into HTTP headers, request objects, and cookies and pass them on to the protected client applications. The client applications can then personalize content using these attributes in their web pages or responses.

Specifically, you can configure the type of attributes to be fetched and the associated mappings for the attributes names used in AM to those values used in the containers. The web policy agent securely fetches the user and session data from the authenticated user as well as policy response attributes.

For example, you can have a web page that addresses the user by name retrieved from the user profile, for example "Welcome Your Name!" AM populates part of the request (header, form data) with the CN from the user profile, and the web site consumes and displays it.

For more details, see [Profile Attributes Processing Properties](#).

1.2.5. FQDN Checking

The web policy agent requires that clients accessing protected resources use valid URLs with fully qualified domain names (FQDNs). If invalid URLs are referenced, policy evaluation can fail as the FQDN will not match the requested URL, leading to blocked access to the resource. Misconfigured URLs can also result in incorrect policy evaluation for subsequent access requests.

There are cases where clients may specify resource URLs that differ from the FQDNs stored in AM policies, for example, in load balanced and virtual host environments. To handle these cases, the web policy agent supports FQDN Checking properties: [FQDN Default](#) and [FQDN Virtual Host Map](#) properties.

The **FQDN Default** property specifies the default URL with valid hostname. The property ensures that the policy agent can redirect to a URL with a valid hostname should it discover an invalid URL in the client request.

The **FQDN Virtual Host Map** property stores map keys and their corresponding values, allowing invalid URLs, load balanced URLs, and virtual host URLs to be correctly mapped to valid URLs. Each entry in the Map has precedence over the **FQDN Default** setting, so that if no valid URLs exist in the **FQDN Virtual Host Map** property, the agent redirects to the value specified in the **FQDN Default** property.

If you want the agent to redirect to a URL other than the one specified in the **FQDN Default** property, then it is good practice to include any anticipated invalid URLs in the **FQDN Virtual Host Map** property and map it to a valid URL.

For more details, see [Fully Qualified Domain Name Checking Properties](#).

1.2.6. Cookie Reset Properties

AM provides cookie reset properties that the agent carries out prior to redirecting the client to a login page for authentication.

Cookie reset is typically used when multiple parallel authentication mechanisms are in play with the policy agent and another authentication system. The policy agent can reset the cookies set by the other mechanism before redirecting the client to a login page.

The cookie reset properties include a name list specifying all of the cookies that will reset, a domain map specifying the domains set for each cookie, and a path map specifying the path from which the cookie will be reset.

If you have enabled attribute fetching using cookies to retrieve user data, it is good practice to use cookie reset, which will reset once you want to access an enforced URL without a valid session.

For more details, see [Cookie Reset Properties](#).

1.2.7. Cross Domain Single Sign-On

Cross domain single sign-on (CDSSO) allows the web policy agent to transfer a validated stateful session ID between an AM domain and an application domain using a proprietary mechanism. Normally, single sign-on cannot be implemented across domains as the session cookie from one domain (for example, website.com) is not accessible from another domain (for example, website.net).

AM's CDSSO solves this cross-domain problem and is best implemented in environments where all the domains are managed by the same organization, and where the AM server is configured to use stateful sessions. AM does not support CDSSO for deployments with stateless sessions.

The web policy agent works with an AM component called a **CDCServlet** that generates a self-submitting form containing the valid session token from one domain. The form gets auto-submitted to the policy agent endpoint via a POST operation. The policy agent processes the request and extracts

the session ID, which is again validated by AM. If validation is successful, the policy agent sets the cookie in alternate domain. The client can then access a resource in that domain.

For more details, see *Configuring Cross Domain Single Sign-On*.

1.2.8. Supporting Load Balancers

The web policy agent provides a number of advanced properties for load balancer deployments fronting multiple policy agents. Properties are available to get the client IP and host name from the load balancer.

If the policy agent is running behind a load balancer, you can configure the policy agent to set a sticky cookie or a query parameter in the URL to ensure subsequent requests are routed to the same instance to preserve session data.

These mechanisms ensure that unauthenticated POST data can be preserved. Policy agents store POST data in the cache and do not share the data among the agents behind the load balancer.

For more details, see Section 2.5, "Configuring Web Policy Agents Behind Load Balancers".

Note

Web policy agents support more than one agent instance running on the same host by properly initializing the multi-process locks/semaphores during the bootstrap process.

Chapter 2

Implementing Web Policy Agents

You install policy agents in web servers and web application containers to enforce access policies AM applies to protected web sites and web applications. Policy agents depend on AM for all authentication and authorization decisions. The primary responsibility of policy agents is to enforce what AM decides in a way that is unobtrusive to the user.

Policy agent configuration is distinct from policy configuration. The only policy-like configurations that you apply to policy agents are:

- URLs to exclude from policy enforcement (*not enforced URLs*)
- Client IP addresses to exclude from policy enforcement (*not enforced IPs*)

2.1. Configuration Location

Policy agent configuration properties are either stored:

- Centrally, in the AM configuration store
- Locally, as a flat file

2.1.1. Centrally Stored Agent Configuration

By default, policy agent configuration settings are stored centrally in the AM configuration store. Storing the policy agent configuration centrally allows you to configure your policy agents by using the AM console, the **ssoadm** command line tool, or the REST API for easier management. Any property change made in AM is immediately communicated to the agent by using a notification. Many policy agent properties are hot-swap enabled, allowing the change to take effect immediately without restarting the policy agent.

You configure policy agents in realms. To access the centralized web policy agent configuration, select **Realms > Realm Name > Applications > Agents > Web > Agent Name** in the AM console.

For more information on creating centrally-stored agent profiles, see Section 2.4, "Creating Agent Profiles".

2.1.2. Locally Stored Agent Configuration

The policy agent installer can create a flat file with the agent configuration. The file is named `agent.conf` and is stored at the path `/web_agents/agent_version/instances/Agent_nnn/config`.

If you choose to use a locally-stored agent configuration, you make all configuration changes by modifying property values in the `agent.conf` file. You cannot make changes using the AM console, command-line interface, or REST API.

When using a locally-stored agent configuration, provide valid values for configuration properties ending in the following strings:

- `.cookie.name`
- `.fqdn.default`
- `.agenturi.prefix`
- `.naming.url`
- `.login.url`
- `.instance.name`
- `.username`
- `.password`
- `.connection_timeout`
- `.policy_clock_skew`

The web policy agent installer populates properties required to connect to an AM instance. Additional properties are needed when settings are stored locally.

2.2. ForgeRock Identity Gateway or Policy Agent?

AM supports both [ForgeRock Identity Gateway](#) and also a variety of policy agents. Identity Gateway and the policy agents can both enforce policy, redirecting users to authenticate when necessary, and controlling access to protected resources. IG runs as a self-contained reverse proxy located between the users and the protected applications. Policy agents are installed into the servers where applications run, intercepting requests in that context.

Use IG to protect access to applications not suited for a policy agent. Not all web servers and Java EE applications have policy agents. Not all operating systems work with policy agents.

Policy agents have the advantage of sitting within your existing server infrastructure. Once you have agents installed into the servers with web applications or sites to protect, then you can manage their configurations centrally from AM.

For organizations with both servers on which you can install policy agents and also applications that you must protect without touching the server, you can use policy agents on the former and IG for the latter.

2.3. Types of Agent

When you open the AM console to configure agents for the top-level realm, you can choose from a number of different types of agents.

Each agent type requires an *agent profile* in AM. The agent profile contains essential configuration for agent operation, such as a password to authenticate the agent, and the URL the agent resides at. For agents that support it, the agent profile can store all agent configuration centrally, rather than locally on the agent server.

Web and J2EE policy agents are the most common, requiring the least integration effort. The available agent types are:

Web

You install web agents in web servers to protect web sites.

J2EE

You install J2EE agents in web application containers to protect web applications.

Web Service Provider

WSP agents are for use with Web Services Security.

Web Service Client

WSC agents are for use with Web Services Security.

STS Client

The Security Token Service client agent is for securing requests to the Security Token Service.

2.2 Agents

Version 2.2 web and Java EE policy agents hold their configuration locally, connecting to AM with a username/password combination. This agent type is provided for backwards compatibility.

OAuth 2.0 Client Agent

OAuth 2.0 clients are registered using this type of policy agent profile.

Agent Authenticator

The agent authenticator can read agent profiles by connecting to AM with a user name, password combination, but unlike the agent profile administrator, cannot change agent configuration.

2.4. Creating Agent Profiles

A policy agent requires a profile to connect to and communicate with AM, regardless of whether it is stored centrally in AM or on the agent server.

Procedure 2.1. To Create an Agent Profile in AM Using the Console

Create an agent profile using the AM console by performing the following steps:

1. In the AM console, navigate to Realms > *Realm Name* > Applications > Agents > Web, and then select the **New** button in the Agent table.
2. Complete the web form using the following hints:

Name

The name for the agent profile. This name is used during the agent installation.

Password

The password the agent uses to authenticate to AM. This password is used during the agent installation.

Configuration

The location where to the agent configuration is stored. Possible values are:

- **Local**. The configuration is stored as a file in the agent installation. To manage the configuration, edit the file to add properties, remove properties, and change values.
- **Centralized**. The configuration is stored in the AM configuration store. To manage the configuration, use the AM console.

Server URL

The full URL to an AM instance. If AM is deployed in a site configuration (behind a load balancer), enter the site URL.

In centralized configuration mode, Server URL is used to populate the agent profile for use with as login, logout, naming, and cross-domain SSO.

Agent URL

The URL the policy agent protects, such as `http://www.example.com:80`

In centralized configuration mode, the Agent URL is used to populate the agent profile for services, such as notifications.

* Name:

* Password:

* Re-Enter Password:

Configuration: ☐ Local ☒ Centralized
Where agent properties are stored. Local is the server on which the agent is running. Centralized is the OpenAM Server

* Server URL:
protocol://host:port/deploymentUri e.g. http://opensso.sample.com:58080/opensso

* Agent URL:
protocol://host:port e.g. http://agent1.sample.com:1234

Procedure 2.2. To Create an Agent Profile Using the `ssoadm` Command

You can create a policy agent profile in AM using the **ssoadm** command-line tool. You do so by specifying the agent properties either as a list of attributes, or by using an agent properties file as shown below. Export an existing policy agent configuration before you start to see what properties you want to set when creating the agent profile.

Perform the following steps to create a policy agent profile using the **ssoadm** command:

1. Make sure the **ssoadm** command is installed. See the section [Installing and Using the Tools in the ForgeRock Access Management Install Guide](#).
2. Determine the list of properties to set in the agent profile using the configuration exported previously and store them in a file, for example, `myAgent.properties`.
3. Create a password file, for example `$HOME/.pwd.txt`. The file should only contain the password string, on a single line.

The password file must be read-only for the user who creates the policy agent profile, and must not be accessible to other users:

```
$ chmod 400 $HOME/.pwd.txt
```

4. Create the agent profile, specifying `--agenttype WebAgent`:

```
$ ssoadm create-agent \
--realm / \
--agentname myAgent \
--agenttype WebAgent \
--adminid amadmin \
--password-file $HOME/.pwd.txt \
--datafile myAgent.properties

Agent configuration was created.
```

5. Review the new profile in the AM console under Realms > *Realm Name* > Applications > Agents > Web > *Agent Name*.

Procedure 2.3. To Create an Agent Profile Group and Inherit Settings

Agent profile groups let you set up multiple agents to inherit settings from the group. To create a new agent profile group, perform the following steps:

1. In the AM console, navigate to Realms > *Realm Name* > Applications > Agents > Web.
2. Select New in the Group table, and provide a name for the group and the URL to the AM server in which to store the profile.

After creating the group profile, you can select the link to the new group profile to fine-tune or export the configuration.

3. Inherit group settings by selecting your agent profile, and then selecting the group name in the Group drop-down list near the top of the profile page.

You can then adjust inheritance by clicking Inheritance Settings on the OpenAM Services agent profile tab.

2.5. Configuring Web Policy Agents Behind Load Balancers

This section addresses the question of configuring policy agents on protected servers that operate behind network load balancers.

2.5.1. The Role of the Load Balancing Layer

A load balancing layer that stands between clients and protected servers can distribute the client load, and fail client traffic over when a protected server goes offline. In the simplest case, the load balancing layer passes requests from the clients to servers and responses from servers to clients, managing the traffic so the client experience is as smooth as possible.

Figure 2.1. Load Balancing With the Same Protocol and Port

If your deployment has protocols and port numbers on the load balancer that match those of the protected servers, see Section 2.5.2, "When Protocols and Port Number Match".

A load balancing layer can also offload processor-intensive public-key encryption algorithms involved in SSL transactions to a hardware accelerator, reducing the load on the protected servers. The client connects to the load balancer over HTTPS, but the load balancer connects to the servers over HTTP.

Figure 2.2. Load Balancing With SSL Offloading

If your deployment uses SSL offloading, see Section 2.5.3, "When Protocols and Port Number Differ".

2.5.2. When Protocols and Port Number Match

When the protocol on the load balancer, such as HTTP or HTTPS, matches the protocol on the protected web server, and the port number the load balancer listens on, such as 80 or 443, matches the port number the protected web server listens on, then the main difference between URLs is in the host names. Map the agent host name to the host name for the load balancer.

Procedure 2.4. To Map the Agent Host Name to the Load Balancer Host Name

When protocols and port numbers match, configure fully qualified domain name (FQDN) mapping.

This procedure explains how to do so for a centralized web policy agent profile configured in the AM console. The steps also mention the properties for web agent profiles that rely on local, file-based configurations:

1. Log in to the AM console as an administrative user with rights to modify the policy agent profile.
2. Navigate to Realms > *Realm Name* > Applications > Agents > Web > *Agent Name* to open the web agent profile for editing.

3. In the Global tab page section Fully Qualified Domain Name Checking, make sure FQDN checking is selected (the default).

The equivalent property setting is `com.sun.identity.agents.config.fqdn.check.enable=true`.

4. Set FQDN Default to the fully qualified domain name of the load balancer, such as `lb.example.com`, rather than the protected server FQDN where the policy agent is installed.

The equivalent property setting is `com.sun.identity.agents.config.fqdn.default=lb.example.com`.

5. Set FQDN Virtual Host Map to map the protected server FQDN to the load balancer FQDN, for example, where the key `agent.example.com` (protected server) has value `lb.example.com` (load balancer).

The equivalent property setting is `com.sun.identity.agents.config.fqdn.mapping[agent.example.com]=lb.example.com`.

6. Save your work, and then restart the protected server.

2.5.3. When Protocols and Port Number Differ

When the load balancer protocol and port, such as HTTPS and 443, differ from the protocol on the protected web server, such as HTTP and 80, then you must override these in the policy agent configuration.

Procedure 2.5. To Override Protocol, Host, and Port

Use the Agent Deployment URI Prefix setting to override the agent protocol, host, and port with that of the load balancer.

Important

The web policy agent configuration for SSL offloading has the side effect of preventing FQDN checking and mapping. As a result, URL rewriting and redirection does not work correctly when the policy agent is accessed directly and not through the load balancer. This should not be a problem for client traffic, but potentially could be an issue for applications accessing the protected server directly, from behind the load balancer.

This procedure explains how to do so for a centralized web policy agent profile configured in the AM console. The steps also mention the properties for web agent profiles that rely on local, file-based configurations:

1. Log in to the AM console as an administrative user with rights to modify the policy agent profile.
2. Navigate to Realms > *Realm Name* > Applications > Agents > Web > *Agent Name* to open the web agent profile for editing.
3. In the Global tab page Profile section, set the Agent Deployment URI Prefix to that of the load balancer.

The value you set here is used when overriding protocol, host, and port on the protected server with the web policy agent.

The property to set is `com.sun.identity.agents.config.agenturi.prefix`.

4. In the Advanced tab page Load Balancer section, enable Load Balancer Setup.

The equivalent property setting is `com.sun.identity.agents.config.load.balancer.enable=true`.

5. Enable Override Request URL Protocol.

The equivalent property setting is `com.sun.identity.agents.config.override.protocol=true`.

6. Enable Override Request URL Host.

The equivalent property setting is `com.sun.identity.agents.config.override.host=true`.

7. Enable Override Request URL Port.

The equivalent property setting is `com.sun.identity.agents.config.override.port=true`.

8. Enable Notification URL when the web policy agent gets notifications about configuration changes.

The equivalent property setting is `com.sun.identity.agents.config.override.notification.url=true`.

9. Save your work, and then restart the protected server.

Chapter 3

Installing Web Policy Agents in Apache HTTP Server

This chapter covers prerequisites and installation procedures for Web Policy Agents 4.1 into Apache HTTP Servers 2.2.x and 2.4.x.

3.1. Downloading and Unzipping the Agent

Navigate to the [ForgeRock BackStage](#) website and choose the agent to download based on your version, architecture, and operating system requirements. Remember to verify the checksum of the downloaded file against the checksum posted on the download page.

Unzip the file in the directory where you plan to store the policy agent's configuration and log files. The following directories are extracted:

bin/

Contains the installation and configuration program **agentadmin**.

config/

Contains configuration templates used by the **agentadmin** command during installation.

instances/

Contains configuration files, and audit and debug logs for individual instances of the web policy agents. The directory is empty when first extracted.

legal/

Contains licensing information including third-party licenses.

lib/

Contains shared libraries used by the policy agent.

log/

Contains log files written during installation. The directory is empty when first extracted.

3.2. Before You Install

Consider the following tips before installing web policy agents into Apache HTTP Server:

- Avoid installing the web server and the web policy agent as root. Instead, create a web server user and install as that user.

If you cannot avoid installing the web server and web policy agent as root, then you must give the user or group that is running the Apache HTTP server read and write permissions to the `logs` and `logs/debug` directories under the agent instance directory (`/web_agents/type/Agent_nnn/logs/`).

Determine which user or group is running the Apache HTTP server by viewing the `Group` and `User` directives in the Apache HTTP server configuration file.

Failure to set permissions causes the web policy agent to fail with an error when attempting to rotate log files.

Tip

The installer can automatically set permissions on folders that require write access, by reading the Apache config file to determine the correct group and user to grant privileges to. Answer `yes` when prompted:

```
Change ownership of created directories using
User and Group settings in httpd.conf
[ q or 'ctrl+c' to exit ]
(yes/no): [no]: yes
```

- The web policy agent replaces authentication functionality provided by Apache, for example, the `mod_auth_*` modules. Integration with built-in Apache httpd authentication directives, such as `AuthName` and `Require` is not supported.
- The SELinux OS feature can prevent the agents from being able to write to audit and debug logs. See Chapter 7, "Troubleshooting".
- Ensure AM is installed and running, so that you can contact AM from the system running the policy agent.
- On Windows operating systems the web policy agents use the native Windows SSL libraries by default if the AM server you will be connecting to uses SSL. You can choose to use OpenSSL instead.

If you choose to use OpenSSL on Windows operating systems, ensure the OpenSSL libraries are available in the correct locations, as shown in the table below:

Table 3.1. OpenSSL DLL Locations on 32-bit and 64-bit Windows

OpenSSL DLL	Location
<code>libeay32.dll</code>	<code>\windows\syswow64</code>

OpenSSL DLL	Location
ssleay32.dll	
libeay64.dll ssleay64.dll	\windows\system32

On UNIX systems, ensure the OpenSSL libraries `libcrypto.so` and `libssl.so` are available in the path specified by either the `LD_LIBRARY_PATH` or `LD_LIBRARY_PATH_64` environment variables.

3.2.1. Tuning Apache Multi-Processing Modules

Apache 2.0 and later comes with Multi-Processing Modules (MPMs) that extend the basic functionality of a web server to support the wide variety of operating systems and customizations for a particular site.

The key area of performance tuning for Apache is to run in worker mode ensuring that there are enough processes and threads available to service the expected number of client requests. Apache performance is configured in the `conf/extra/httpd-mpm.conf` file.

The key properties in this file are `ThreadsPerChild` and `MaxClients`. Together the properties control the maximum number of concurrent requests that can be processed by Apache. The default configuration allows for 150 concurrent clients spread across 6 processes of 25 threads each.

```
<IfModule mpm_worker_module>
  StartServers      2
  MaxClients       150
  MinSpareThreads   25
  MaxSpareThreads   75
  ThreadsPerChild   25
  MaxRequestsPerChild 0
</IfModule>
```

Important

For the policy agent notification feature, the `MaxSpareThreads`, `ThreadLimit` and `ThreadsPerChild` default values must *not* be altered; otherwise the notification queue listener thread cannot be registered.

Any other values apart from these three in the worker MPM can be customized. For example, it is possible to use a combination of `MaxClients` and `ServerLimit` to achieve a high level of concurrent clients.

3.3. Installing Apache Web Policy Agents

Complete the following procedures to install Web Policy Agents 4.1 into Apache HTTP Servers:

Procedure 3.1. To Complete Pre-Installation Tasks

Perform the following steps to create the configuration required by the policy agent before installing it:

1. Create at least one policy in AM to protect resources with the agent, as described in the procedure *Implementing Authorization Using the Access Management Console*. Consider creating a simple policy, such as a policy that allows only authenticated users to access your resources. This allows you to test your policy agent after installation.
2. Create an agent profile in AM, required by the policy agent to connect and communicate with AM. For more information, see Section 2.4, "Creating Agent Profiles".
3. Configure your AM instance to support single sign-on (SSO) or cross-domain SSO. Choose one of the following options depending on your environment:
 - To configure an AM instance and a policy agent on two different cookie domains, such as `example.org` and `example.net`, set up cross-domain SSO.

For more information, see *Implementing Cross-Domain Single Sign-On*.

 - To configure an AM instance and a policy agent on the same cookie domain, such as `example.net`, set up SSO.

For more information, see *Implementing Single Sign-On Within One Domain*.
4. Create a text file containing only the password specified when creating the agent profile, and protect it:

Windows example:

```
C:\> echo password > pwd.txt
```

In Windows Explorer, right-click the password file, for example `pwd.txt`, select Read-Only, and then click OK.

UNIX example:

```
$ echo password > /tmp/pwd.txt
```

```
$ chmod 400 /tmp/pwd.txt
```

Procedure 3.2. To Install the Web Policy Agent into Apache

This procedure shows how to install into Apache 2.4. If installing into Apache 2.2, alter the path names accordingly.

1. Check the information in Section 3.2, "Before You Install" before proceeding.
2. Shut down the Apache server where you plan to install the agent.
3. Make sure AM is running.
4. Run the **agentadmin --i** command to install the agent. You will be prompted to read and accept the software license agreement for the agent installation.

- UNIX example:

```
$ cd /web_agents/apache24_agent/bin/
$ ./agentadmin --i
```

- Windows example:

```
C:\> cd web_agents\apache24_agent\bin
C:\path\to\web_agents\apache24_agent\bin> agentadmin.exe --i
```

5. When prompted for information, enter the inputs appropriate for your deployment.

Tip

You can cancel web policy agent installation at anytime by pressing **CTRL+C**

- a. Enter the full path to the Apache HTTP Server configuration file. The installer modifies this file to include the web policy agent configuration and module.

```
Enter the complete path to the httpd.conf file which is used by Apache HTTPD
Server to store its configuration.
[ q or 'ctrl+c' to exit ]
Configuration file [/opt/apache/conf/httpd.conf]: /etc/httpd/conf/httpd.conf
```

- b. The installer can change the directory ownership to the same User and Group specified in the Apache configuration. Enter **yes** to alter directory ownership, press **Enter** to accept the default: **no**.

```
Change ownership of created directories using
User and Group settings in httpd.conf
[ q or 'ctrl+c' to exit ]
(yes/no): [no]: yes
```

- c. The installer can import settings from an existing web policy agent into the new installation and skips prompts for any values present in the existing configuration file. You will be required to re-enter the agent profile password.

Enter the full path to an existing agent configuration file to import the settings, or press **Enter** to skip the import.

```
To set properties from an existing configuration enter path to file
[ q or 'ctrl+c' to exit, return to ignore ]
Existing agent.conf file:
```

- d. Enter the full URL of the AM instance the web policy agents will be using. Ensure that the deployment URI is specified.

```
Enter the URL where the AM server is running. Please include the
deployment URI also as shown below:
(http://openam.sample.com:58080/openam)
[ q or 'ctrl+c' to exit ]
OpenAM server URL: http://openam.example.com:8080/openam
```

- e. Enter the full URL of the server the agent is running on.

```
Enter the Agent URL as shown below:
(http://agent.sample.com:1234)
[ q or 'ctrl+c' to exit ]
Agent URL: http://www.example.com:80
```

- f. Enter the name given to the agent profile created in AM.

```
Enter the Agent profile name
[ q or 'ctrl+c' to exit ]
Agent Profile name: webagent4
```

- g. Enter the AM realm containing the agent profile.

```
Enter the Agent realm/organization
[ q or 'ctrl+c' to exit ]
Agent realm/organization name: [/]: /
```

- h. Enter the full path to the file containing the agent profile password created earlier.

```
Enter the path to a file that contains the password to be used
for identifying the Agent
[ q or 'ctrl+c' to exit ]
The path to the password file: /tmp/pwd.txt
```

- i. The installer displays a summary of the configuration settings you specified.

- If a setting is incorrect, type **no**, or press **Enter**. The installer loops through the configuration prompts again, using your provided settings as the default. Press **Enter** to accept each one, or enter a replacement setting.
- If the settings are correct, type **yes** to proceed with installation.

```
Installation parameters:

OpenAM URL: http://openam.example.com:8080/openam
Agent URL: http://www.example.com:80
Agent Profile name: webagent4
Agent realm/organization name: /
Agent Profile password source: /tmp/pwd.txt

Confirm configuration (yes/no): [no]: yes
Validating...
Validating... Success.
Cleaning up validation data...
Creating configuration...
Installation complete.
```

Upon successful completion, the installer adds the agent as a module to the Apache HTTP Server configuration file. You can find a backup configuration file in the Apache HTTP Server configuration directory, called `http.conf_amagent_date_and_time_of_installation`.

The installer also sets up configuration and log directories for the agent instance. Each agent instance that you install on the system has its own numbered configuration and logs directory. The first agent's configuration and logs are located under the directory `web_agents/apache24_agent/instances/agent_1/`.

The configuration files and log locations are as follows:

`config/agent.conf`

Contains the bootstrap properties the web policy agent requires to connect to AM and download its configuration. Also contains properties that are only used if you configure the web policy agent to use local configuration.

`logs/audit/`

Audit log directory, used if the `local` or `all` audit locations are enabled.

`logs/debug/`

Debug directory where the `debug.log` debug file resides. Useful in troubleshooting policy agent issues.

6. Start the Apache server in which you installed the web policy agent.

Procedure 3.3. To Check the Policy Agent Installation

1. Check the Apache HTTP server error log after you start the server to make sure startup completed successfully:

```
[Tue Sep 08 15:51:27.667625 2016] AH00163:
Apache/2.4.6 (CentOS) OpenAM Web Agent/4.1 configured
-- resuming normal operations
```

2. Make an HTTP request to a resource protected by the agent, then check the `/web_agents/apache24_agent/instances/Agent_1/logs/debug/debug.log` file to verify that no errors occurred on startup. Expected output should resemble the following:

```
2016-11-18 11:59:22.255 +0000 INFO [4900:6260]

#####
OpenAM Web Agent
Version: 4.1
Revision: 5bf61d2
Build date: Nov 8 2016 11:29:54
#####
```

3. (Optional) If you have a policy configured, you can test that your policy agent is processing requests. For example, when you make an HTTP request to a resource protected by the agent you should be redirected to AM to authenticate. As an example, authenticate as user `demo`, password `changeit`. After you authenticate, AM redirects you back to the resource you tried to access.

3.4. Installing Apache Web Policy Agents into a Virtual Host

Complete the following procedures to install Web Policy Agents 4.1 into Apache HTTP Server virtual hosts.

Installing into an Apache virtual host is a manual process, which involves copying an instance directory created by the **agentadmin** installer and adding to the Apache configuration file of the virtual host.

You will also need to have installed a web policy agent into the default root Apache configuration file before installing into a virtual host. See Section 3.3, "Installing Apache Web Policy Agents".

Procedure 3.4. To Complete Pre-Installation Tasks

Perform the following steps to create the configuration required by the policy agent before installing it:

1. Create at least one policy in AM to protect resources with the agent, as described in the procedure *Implementing Authorization Using the Access Management Console*. Consider creating a simple policy, such as a policy that allows only authenticated users to access your resources. This allows you to test your policy agent after installation.
2. Create an agent profile in AM, required by the policy agent to connect and communicate with AM. For more information, see Section 2.4, "Creating Agent Profiles".
3. Configure your AM instance to support single sign-on (SSO) or cross-domain SSO. Choose one of the following options depending on your environment:

- To configure an AM instance and a policy agent on two different cookie domains, such as `example.org` and `example.net`, set up cross-domain SSO.

For more information, see *Implementing Cross-Domain Single Sign-On*.

- To configure an AM instance and a policy agent on the same cookie domain, such as `example.net`, set up SSO.

For more information, see *Implementing Single Sign-On Within One Domain*.

4. Create a text file containing only the password specified when creating the agent profile, and protect it:

Windows example:

```
C:\> echo password > pwd.txt
```

In Windows Explorer, right-click the password file, for example `pwd.txt`, select Read-Only, and then click OK.

UNIX example:

```
$ echo password > /tmp/pwd.txt
```

```
$ chmod 400 /tmp/pwd.txt
```

Procedure 3.5. To Install the Web Policy Agent into Apache Virtual Hosts

This procedure assumes you have installed a web policy agent into the default root configuration of your Apache HTTP Server installation, with configuration in `/web_agents/apache24_agent/instances/agent_1`. To install into a virtual host, copy this configuration folder, modify required settings, and enable the web policy agent in the virtual host configuration file.

1. Check the information in Section 3.2, "Before You Install" before proceeding.
2. Shut down the Apache server where you plan to install the agent.
3. Locate the web policy agent configuration instance to duplicate, and make a copy, for example `agent_2`:

- UNIX example:

```
$ cd /web_agents/apache24_agent/instances
$ cp -r agent_1 agent_2
```

- Windows example:

```
c:\> cd c:\web_agents\apache24_agent\instances
c:\path\to\web_agents\apache24_agent\instances> xcopy /E /I agent_1 agent_2
```

4. Give the user that runs the virtual host modify privileges to the new instance folder. The following examples demonstrate giving privileges to the `agent_2` configuration instance to a user named `apache`:

- UNIX example:

```
$ cd /web_agents/apache24_agent/instances
$ chown -hR apache agent_2
```

- Windows example:

```
c:\> cd c:\web_agents\apache24_agent\instances
c:\path\to\web_agents\apache24_agent\instances> icacls "agent_2" /grant apache:M
```

5. In the new instance folder, edit the `/config/agent.conf` configuration file as follows:
 - a. Alter the value of `com.sun.identity.agents.config.username` to be the name of the agent profile you created in AM for the virtual host.
 - b. (Optional) If you used a different password when creating the new agent profile in AM, you will need to configure the encryption key and password value in the agent configuration file.

Generate a new signing key, by running **agentadmin --k**.

Use the generated encryption key to encrypt the new password, by running `agentadmin --p`, specifying the encryption key and the new password:

- UNIX example:

```
$ ./agentadmin --p "YWM00ThlMTQtMzMxOS05Nw==" "newpassword"
Encrypted password value: 07bJ0SeM/G8yd04=
```

- Windows example:

```
C:\path\to\web_agents\apache24_agent\bin>
agentadmin --p "YWM00ThlMTQtMzMxOS05Nw==" "newpassword"
Encrypted password value: 07bJ0SeM/G8yd04=
```

In the agent configuration file of the new instance, set the following properties:

- `com.sun.identity.agents.config.key` to be the generated encryption key value.

For example:

```
com.sun.identity.agents.config.key = YWM00ThlMTQtMzMxOS05Nw==
```

- `com.sun.identity.agents.config.password` to be the generated encrypted password value.

For example:

```
com.sun.identity.agents.config.password = 07bJ0SeM/G8yd04=
```

- c. Replace any references to the original instance directory with the new instance directory. For example, replace the string `agent_1` with `agent_2` wherever it occurs in the configuration file.

Configuration options that are likely to require alterations include:

- `com.sun.identity.agents.config.local.logfile`
- `com.sun.identity.agents.config.local.audit.logfile`

- d. Replace any references to the original website being protected with the new website being protected. For example, replace `http://www.example.com:80/amagent` with `http://customers.example.com:80/amagent`.

Configuration options that are likely to require alterations include:

- `com.sun.identity.client.notification.url`
- `com.sun.identity.agents.config.agenturi.prefix`
- `com.sun.identity.agents.config.fqdn.default`

- e. Save and close the configuration file.

6. Edit the Apache HTTP Server configuration file. This is the same file specified when installing the web policy agent into the default Apache website. For example, `/etc/httpd/conf/httpd.conf`.
- a. At the end of the file the installer will have added three new lines of settings, for example:

```
LoadModule amagent_module /web_agents/apache24_agent/lib/mod_openam.so
AmAgent On
AmAgentConf /web_agents/apache24_agent/bin/./instances/agent_1/config/agent.conf
```

Leave the first line, `LoadModule ...`, and move the other two lines into the virtual host configuration element of the default site, for example:

```
<VirtualHost *:80>
# This first-listed virtual host is also the default for *:80
ServerName www.example.com
ServerAlias example.com
DocumentRoot "/var/www/html"
AmAgent On
AmAgentConf /web_agents/apache24_agent/instances/agent_1/config/agent.conf
</VirtualHost>
```

- b. Copy the same two lines into the new virtual host, and replace `agent_1` with the new agent configuration instance folder, for example `agent_2`:

```
<VirtualHost *:80>
ServerName customers.example.com
DocumentRoot "/var/www/customers"
AmAgent On
AmAgentConf /web_agents/apache24_agent/instances/agent_2/config/agent.conf
</VirtualHost>
```

Tip

If the new virtual host configuration is in a separate file, copy the two configuration lines into the `VirtualHost` element within that file.

7. Save and close the Apache HTTP Server configuration file.
8. Start the Apache HTTP server in which you installed the web policy agent.

Procedure 3.6. To Check the Policy Agent Installation

1. Check the Apache HTTP server error log after you start the server to make sure startup completed successfully:

```
[Tue Sep 08 15:51:27.667625 2016] AH00163:
Apache/2.4.6 (CentOS) OpenAM Web Agent/4.1 configured
-- resuming normal operations
```

2. Make an HTTP request to a resource protected by the agent, then check the `/web_agents/apache24_agent/instances/Agent_1/logs/debug/debug.log` file to verify that no errors occurred on startup. Expected output should resemble the following:

```
2016-11-18 11:59:22.255 +0000    INFO [4900:6260]

#####
OpenAM Web Agent
Version: 4.1
Revision: 5bf61d2
Build date: Nov  8 2016 11:29:54
#####
```

3. (Optional) If you have a policy configured, you can test that your policy agent is processing requests. For example, when you make an HTTP request to a resource protected by the agent you should be redirected to AM to authenticate. As an example, authenticate as user `demo`, password `changeit`. After you authenticate, AM redirects you back to the resource you tried to access.

3.5. Installing Apache Web Policy Agents Silently

You can run a silent, non-interactive installation by running **agentadmin --s**, along with arguments used to configure the instance.

The required arguments, and the order in which to specify them are:

Web server configuration file

Enter the full path to the Apache HTTP server configuration file. The installer modifies this file to include the web policy agent configuration and module.

OpenAM URL

Enter the full URL of the AM instance the web policy agents will be using. Ensure the deployment URI is specified.

Agent URL

Enter the full URL of the server the agent is running on.

Realm

Enter the AM realm containing the agent profile.

Agent profile name

Enter the name given to the agent profile created in AM.

Agent profile password

Enter the full path to the file containing the agent profile password.

--changeOwner

To have the installer change the ownership of created directories to be the same User and Group as specified in the Apache configuration, specify the optional `--changeOwner` switch.

--acceptLicence

You can suppress the license agreement prompt during a silent, non-interactive install by including the `--acceptLicence` parameter. The inclusion of the option indicates that you have read and accepted the terms stated in the license. To view the license agreement, open `/path/to/web_agents/agent_type/legal/Forgerock_License.txt`.

--forceInstall

Optionally have the installer proceed with a silent installation even if it cannot connect to the specified AM server during installation, rather than exiting.

Complete the following procedures to install a web policy agent silently into Apache HTTP Server:

Procedure 3.7. To Complete Pre-Installation Tasks

Perform the following steps to create the configuration required by the policy agent before installing it:

1. Create at least one policy in AM to protect resources with the agent, as described in the procedure *Implementing Authorization Using the Access Management Console*. Consider creating a simple policy, such as a policy that allows only authenticated users to access your resources. This allows you to test your policy agent after installation.
2. Create an agent profile in AM, required by the policy agent to connect and communicate with AM. For more information, see Section 2.4, "Creating Agent Profiles".
3. Configure your AM instance to support single sign-on (SSO) or cross-domain SSO. Choose one of the following options depending on your environment:

- To configure an AM instance and a policy agent on two different cookie domains, such as `example.org` and `example.net`, set up cross-domain SSO.

For more information, see *Implementing Cross-Domain Single Sign-On*.

- To configure an AM instance and a policy agent on the same cookie domain, such as `example.net`, set up SSO.

For more information, see *Implementing Single Sign-On Within One Domain*.

4. Create a text file containing only the password specified when creating the agent profile, and protect it:

Windows example:

```
C:\> echo password > pwd.txt
```

In Windows Explorer, right-click the password file, for example `pwd.txt`, select Read-Only, and then click OK.

UNIX example:

```
$ echo password > /tmp/pwd.txt
```

```
$ chmod 400 /tmp/pwd.txt
```

Procedure 3.8. To install Web Policy Agents in Apache Silently

1. Check the information in Section 3.2, "Before You Install" before proceeding.
2. Shut down the Apache server where you plan to install the agent.
3. Make sure AM is running.
4. Run the **agentadmin --s** command with the required arguments. For example:

```
$ agentadmin --s \
  "/etc/httpd/conf/httpd.conf" \
  "http://openam.example.com:8080/openam" \
  "http://www.example.com:80" \
  "/" \
  "webagent4" \
  "/tmp/pwd.txt" \
  --changeOwner \
  --acceptLicence
```

OpenAM Web Agent for Apache Server installation.

```
Validating...
Validating... Success.
Cleaning up validation data...
Creating configuration...
Installation complete.
```

3.6. Removing Apache Web Policy Agents

Complete the following steps to remove an Apache HTTP Server policy agent:

Procedure 3.9. To remove Web Policy Agents from Apache HTTP Server

1. Shut down the Apache server where the agent is installed.
2. Run **agentadmin --l** to output a list of the installed web policy agent configuration instances.

Make a note of the ID value of the configuration instance you want to remove.

3. Run **agentadmin --r**, and specify the ID of the web policy agent configuration instance to remove. A warning is displayed. Type **yes** to proceed with removing the configuration instance.

```
$ ./agentadmin --r agent_3
```

```
Warning! This procedure will remove all OpenAM Web Agent references from  
a Web server configuration. In case you are running OpenAM Web Agent in a  
multi-virtualhost mode, an uninstallation must be carried out manually.
```

```
Continue (yes/no): [no]: yes
```

```
Removing agent_3 configuration...  
Removing agent_3 configuration... Done.
```

4. Restart the Apache HTTP Server.

Chapter 4

Installing Web Policy Agents in Microsoft IIS

This chapter covers prerequisites and installation procedures for Web Policy Agents 4.1 into Microsoft Internet Information Services (IIS) 7 and 8.

4.1. Downloading and Unzipping the Agent

Navigate to the [ForgeRock BackStage](#) website and choose the agent to download based on your version, architecture, and operating system requirements. Remember to verify the checksum of the downloaded file against the checksum posted on the download page.

Unzip the file in the directory where you plan to store the policy agent's configuration and log files. The following directories are extracted:

bin/

Contains the installation and configuration program **agentadmin**.

config/

Contains configuration templates used by the **agentadmin** command during installation.

instances/

Contains configuration files, and audit and debug logs for individual instances of the web policy agents. The directory is empty when first extracted.

legal/

Contains licensing information including third-party licenses.

lib/

Contains shared libraries used by the policy agent.

log/

Contains log files written during installation. The directory is empty when first extracted.

4.2. Before You Install

Consider the following tips before installing web policy agents into IIS servers:

- Ensure AM is installed and running, so that you can contact AM from the system running the policy agent.
- Web policy agents use the native Windows SSL libraries by default if the AM server uses SSL/TLS. You can choose to use OpenSSL instead.

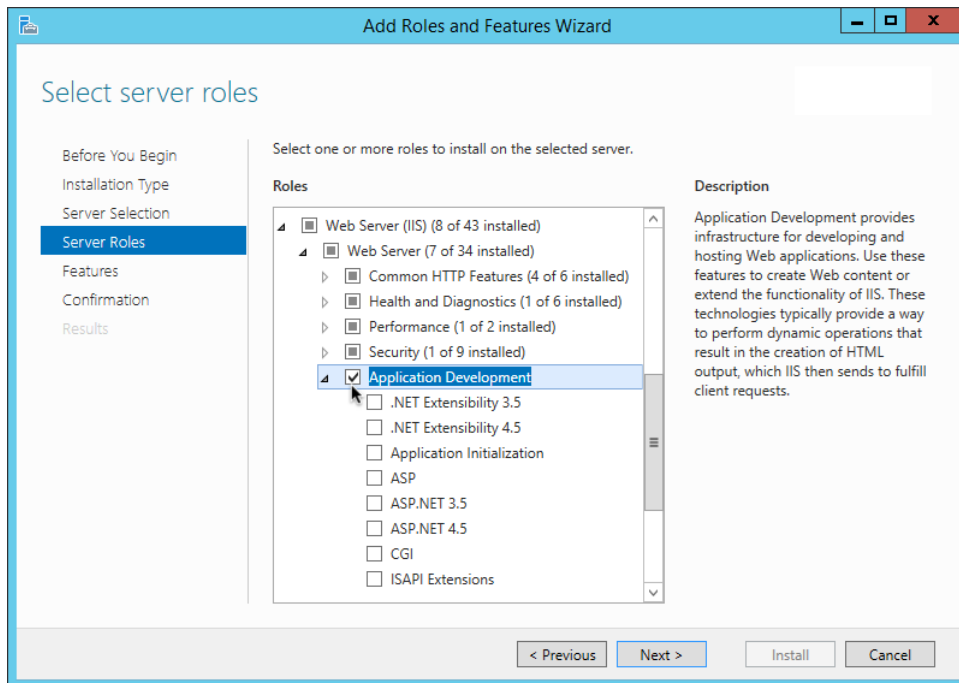

If you choose to use OpenSSL, ensure the OpenSSL libraries are available in the correct locations, as shown in the table below:

Table 4.1. OpenSSL DLL Locations on 32-bit and 64-bit Windows

OpenSSL DLL	Location
libeay32.dll ssleay32.dll	\windows\syswow64
libeay64.dll ssleay64.dll	\windows\system32

- Web policy agents require that the *Application Development* component is installed alongside the core IIS services. Application Development is an optional component of the IIS web server. The component provides required infrastructure for hosting web applications.

Figure 4.1. Adding the Application Development Component to IIS

4.3. Installing IIS Web Policy Agents

Complete the following procedures to install Web Policy Agents 4.1 into Microsoft IIS servers.

Procedure 4.1. To Complete Pre-Installation Tasks

Perform the following steps to create the configuration required by the policy agent before installing it:

1. Create at least one policy in AM to protect resources with the agent, as described in the procedure *Implementing Authorization Using the Access Management Console*. Consider creating a simple policy, such as a policy that allows only authenticated users to access your resources. This allows you to test your policy agent after installation.
2. Create an agent profile in AM, required by the policy agent to connect and communicate with AM. For more information, see [Section 2.4, "Creating Agent Profiles"](#).
3. Configure your AM instance to support single sign-on (SSO) or cross-domain SSO. Choose one of the following options depending on your environment:

- To configure an AM instance and a policy agent on two different cookie domains, such as `example.org` and `example.net`, set up cross-domain SSO.

For more information, see *Implementing Cross-Domain Single Sign-On*.

- To configure an AM instance and a policy agent on the same cookie domain, such as `example.net`, set up SSO.

For more information, see *Implementing Single Sign-On Within One Domain*.

4. Create a text file containing only the password specified when creating the agent profile, and protect it:

Windows example:

```
C:\> echo password > pwd.txt
```

In Windows Explorer, right-click the password file, for example `pwd.txt`, select Read-Only, and then click OK.

UNIX example:

```
$ echo password > /tmp/pwd.txt
```

```
$ chmod 400 /tmp/pwd.txt
```

Procedure 4.2. To Install the Policy Agent into IIS

1. Check the information in [Section 4.2, "Before You Install"](#) before proceeding.

2. Log on to Windows as a user with administrator privileges.
3. Make sure AM is running.
4. Run **agentadmin.exe** with the **--i** switch to install the agent. You will be prompted to read and accept the software license agreement for the agent installation.

```
c:\> cd web_agents\iis_agent\bin
c:\web_agents\iis_agent\bin> agentadmin.exe --i
```

5. When prompted for information, enter the inputs appropriate for your deployment.

Tip

You can cancel web policy agent installation at anytime by pressing **CTRL+C**

- a. Enter the ID number of the IIS site in which to install the web policy agent.

```
IIS Server Site configuration:

Number of Sites: 2
id: 1   name: "DEFAULT WEB SITE"
id: 2   name: "CUSTOMERPORTAL"

Enter IIS Server Site identification number.
[ q or 'ctrl+c' to exit ]
Site id: 2
```

- b. The installer can import settings from an existing web policy agent into the new installation and skips prompts for any values present in the existing configuration file. You will be required to re-enter the agent profile password.

Enter the full path to an existing agent configuration file to import the settings, or press **Enter** to skip the import.

```
To set properties from an existing configuration enter path to file
[ q or 'ctrl+c' to exit, return to ignore ]
Existing agent.conf file:
```

- c. Enter the full URL of the AM instance the web policy agents will be using. Ensure the deployment URI is specified.

```
Enter the URL where the AM server is running. Please include the
deployment URI also as shown below:
(http://openam.sample.com:8080/openam)
[ q or 'ctrl+c' to exit ]
OpenAM server URL: http://openam.example.com:8080/openam
```

- d. Enter the full URL of the site the agent will be running in.

```
Enter the Agent URL as shown below:
(http://agent.sample.com:1234)
[ q or 'ctrl+c' to exit ]
Agent URL: http://customers.example.com:80
```

- e. Enter the name given to the agent profile created in AM.

```
Enter the Agent profile name
[ q or 'ctrl+c' to exit ]
Agent Profile name: iisagent
```

- f. Enter the AM realm containing the agent profile.

```
Enter the Agent realm/organization
[ q or 'ctrl+c' to exit ]
Agent realm/organization name: [/]: /
```

- g. Enter the full path to the file containing the agent profile password created earlier.

```
Enter the path to a file that contains the password to be used
for identifying the Agent
[ q or 'ctrl+c' to exit ]
The path to the password file: c:\pwd.txt
```

- h. The installer displays a summary of the configuration settings you specified.

- If a setting is incorrect, type **no**, or press **Enter**. The installer loops through the configuration prompts using your provided settings as the default. Press **Enter** to accept each one, or enter a replacement setting.
- If the settings are correct, type **yes** to proceed with installation.

```
Installation parameters:

OpenAM URL: http://openam.example.com:8080/openam
Agent URL: http://customers.example.com:80
Agent Profile name: iisagent
Agent realm/organization name: /
Agent Profile password source: c:\pwd.txt

Confirm configuration (yes/no): [no]: yes
Validating...
Validating... Success.
Cleaning up validation data...
Creating configuration...
Installation complete.
```

Upon successful completion, the installer adds the agent as a module to the IIS site configuration.

The installer also sets up configuration and log directories for the agent instance. Each agent instance that you install on the system has its own numbered configuration and logs directory. The first agent's configuration and logs are located under the directory `web_agents\iis_agent\instances\agent_1\`.

Note

The installer grants full access permissions on the created instance folder to the user that the selected IIS site is running under, so that log files can be written correctly.

The configuration files and log locations are as follows:

config/agent.conf

Contains the bootstrap properties the web policy agent requires to connect to AM and download its configuration. Also contains properties that are only used if you configure the web policy agent to use local configuration.

logs/audit/

Audit log directory, used if the `local` or `all` audit locations are enabled.

logs/debug/

Debug directory where the `debug.log` debug file resides. Useful in troubleshooting policy agent issues.

4.4. Installing IIS Web Policy Agents Silently

You can run a silent, non-interactive installation by running **agentadmin.exe --s**, along with arguments used to configure the instance.

The required arguments, and the order in which to specify them are:

Web server configuration file

Enter the ID number of the IIS site in which to install the web policy agent.

Tip

To list the sites in an IIS server, run **agentadmin.exe --n**:

OpenAM URL

Enter the full URL of the AM instance the web policy agents will be using. Ensure the deployment URI is specified.

Agent URL

Enter the full URL of the IIS site the agent will be running on.

Realm

Enter the AM realm containing the agent profile.

Agent profile name

Enter the name given to the agent profile created in AM.

Agent profile password

Enter the full path to the file containing the agent profile password.

`--changeOwner`

Optionally have the installer change the ownership of created directories to be the same user that is running the selected IIS site.

`--acceptLicence`

You can suppress the license agreement prompt during a silent, non-interactive install by including the `--acceptLicence` parameter. The inclusion of the option indicates that you have read and accepted the terms stated in the license. To view the license agreement, open `/path/to/web_agents/agent_type/legal/Forgerock_License.txt`.

`--forceInstall`

Add this optional switch to have the installer proceed with a silent installation even if it cannot connect to the specified AM server during installation, rather than exiting.

Complete the following procedures to install a web policy agent silently into an IIS server:

Procedure 4.3. To Complete Pre-Installation Tasks

Perform the following steps to create the configuration required by the policy agent before installing it:

1. Create at least one policy in AM to protect resources with the agent, as described in the procedure *Implementing Authorization Using the Access Management Console*. Consider creating a simple policy, such as a policy that allows only authenticated users to access your resources. This allows you to test your policy agent after installation.
2. Create an agent profile in AM, required by the policy agent to connect and communicate with AM. For more information, see Section 2.4, "Creating Agent Profiles".
3. Configure your AM instance to support single sign-on (SSO) or cross-domain SSO. Choose one of the following options depending on your environment:
 - To configure an AM instance and a policy agent on two different cookie domains, such as `example.org` and `example.net`, set up cross-domain SSO.

For more information, see *Implementing Cross-Domain Single Sign-On*.

- To configure an AM instance and a policy agent on the same cookie domain, such as `example.net`, set up SSO.

For more information, see *Implementing Single Sign-On Within One Domain*.

4. Create a text file containing only the password specified when creating the agent profile, and protect it:

Windows example:

```
C:\> echo password > pwd.txt
```

In Windows Explorer, right-click the password file, for example `pwd.txt`, select Read-Only, and then click OK.

UNIX example:

```
$ echo password > /tmp/pwd.txt
```

```
$ chmod 400 /tmp/pwd.txt
```

Procedure 4.4. To install Web Policy Agents in IIS Silently

1. Check the information in Section 4.2, "Before You Install" before proceeding.
2. Make sure AM is running.
3. Run the **agentadmin --s** command with the required arguments. For example:

```
c:\web_agents\iis_agent\bin> agentadmin.exe --s ^
"1" ^
"http://openam.example.com:8080/openam" ^
"http://iis.example.com:80" ^
"/" ^
"iisagent" ^
"c:\pwd.txt" ^
--changeOwner ^
--acceptLicence
```

OpenAM Web Agent for IIS Server installation.

```
Validating...
Validating... Success.
Cleaning up validation data...
Creating configuration...
Installation complete.
```

4.5. Managing IIS Web Policy Agents

This section explains how to disable, enable, and remove web policy agents that are in an IIS site, and how to completely uninstall web policy agents from IIS.

Procedure 4.5. To Disable and Enable a Web Policy Agent in an IIS site

1. Log on to Windows as a user with administrator privileges.
2. Run **agentadmin.exe --l** to output a list of the installed web policy agent configuration instances.

```
c:\web_agents\iis_agent\bin> agentadmin.exe --l
OpenAM Web Agent Configuration instances:

id:          agent_1
configuration: c:\web_agents\iis_agent\bin\..\instances\agent_1
server/site:  2
```

Make a note of the ID value of the configuration instance you want to disable or enable.

3. Perform one of the following steps:
 - To disable the web policy agent in a site, run **agentadmin.exe --d**, and specify the ID of the web policy agent configuration instance to disable.

```
c:\web_agents\iis_agent\bin> agentadmin.exe --d agent_1

Disabling agent_1 configuration...
Disabling agent_1 configuration... Done.
```

- To enable the web policy agent in a site, run **agentadmin.exe --e**, and specify the ID of the web policy agent configuration instance to enable.

```
c:\web_agents\iis_agent\bin> agentadmin.exe --e agent_1

Enabling agent_1 configuration...
Enabling agent_1 configuration... Done.
```

Procedure 4.6. To Remove a Web Policy Agent from an IIS site

1. Log on to Windows as a user with administrator privileges.
2. Run **agentadmin.exe --l** to output a list of the installed web policy agent configuration instances.

```
c:\web_agents\iis_agent\bin> agentadmin.exe --l
OpenAM Web Agent Configuration instances:

id:          agent_1
configuration: c:\web_agents\iis_agent\bin\..\instances\agent_1
server/site:  2
```

Make a note of the ID value of the configuration instance you want to remove.

3. Run **agentadmin.exe --r**, and specify the ID of the web policy agent configuration instance to remove.

```
c:\web_agents\iis_agent\bin> agentadmin.exe --r agent_1  
  
Removing agent_1 configuration...  
Removing agent_1 configuration... Done.
```

Procedure 4.7. To Remove Web Policy Agents from IIS

1. Log on to Windows as a user with administrator privileges.
2. Run **agentadmin --g**. A warning is displayed. Type **yes** to proceed with removing the configuration instance.

```
c:\web_agents\iis_agent\bin> agentadmin.exe --g  
  
Warning! This procedure will remove all OpenAM Web Agent references from  
IIS Server configuration.  
  
Continue (yes/no): [no]: yes  
  
Removing agent module from IIS Server configuration...  
Removing agent module from IIS Server configuration... Done.
```

4.6. Enable IIS Basic Authentication and Password Replay Support

The IIS web policy agent now supports IIS basic authentication and password replay. You must use the appropriate software versions.

Given the proper configuration and with Active Directory as a user data store for AM, the IIS web policy agent can provide access to the IIS server variables. The instructions for configuring the capability follow in this section, though you should read the section in full, also paying attention to the required workarounds for Microsoft issues.

When configured as described, the policy agent requests IIS server variable values from AM, which gets them from Active Directory. The policy agent then sets the values in HTTP headers so that they can be accessed by your application.

The following IIS server variables all take the same value when set: **REMOTE_USER**, **AUTH_USER**, and **LOGON_USER**. The policy agent either sets all three, or does not set any of them.

When you enable Logon and Impersonation in the console (**com.sun.identity.agents.config.iis.logonuser=true** in the policy agent configuration), the policy agent performs Windows logon and sets the user impersonation token in the IIS session context.

When you enable Show Password in HTTP Header in the console (**com.sun.identity.agents.config.iis.password.header=true** in the policy agent configuration), the policy agent adds it in the **USER_PASSWORD** header.

The policy agent does not modify any other IIS server variables related to the authenticated user's session.

The policy agent works best with IIS running in Integrated, not Classic mode. In Classic mode, you cannot share sessions between the policy agent and another .NET application, so Logon and Impersonation are not operative. Furthermore IIS in Classic mode treats all modules as ISAPI extensions, and request processing is affected. It is therefore strongly recommended that you run IIS in Integrated mode:

- For Microsoft Office integration, you must use Microsoft Office 2007 SP2 or later.
- For Microsoft SharePoint integration, you must use Microsoft SharePoint Server 2007 SP2 or later.

You must also apply workarounds as described for the following Microsoft issues.

Microsoft Support Issue: 841215

Link: <http://support.microsoft.com/kb/841215>

Description: Error message when you try to connect to a Windows SharePoint document library: "System error 5 has occurred".

Summary: Enable Basic Authentication on the client computer.

Microsoft Support Issue: 870853

Link: <http://support.microsoft.com/kb/870853>

Description: Office 2003 and 2007 Office documents open read-only in Internet Explorer.

Summary: Add registry keys as described in Microsoft's support document.

Microsoft Support Issue: 928692

Link: <http://support.microsoft.com/kb/928692>

Description: Error message when you open a Web site by using Basic authentication in Expression Web on a computer that is running Windows Vista: "The folder name is not valid".

Summary: Edit the registry as described in Microsoft's support document.

Microsoft Support Issue: 932118

Link: <http://support.microsoft.com/kb/932118>

Description: Persistent cookies are not shared between Internet Explorer and Office applications.

Summary: Add the web site the list of trusted sites.

Microsoft Support Issue: 943280

Link: <http://support.microsoft.com/kb/943280>

Description: Prompt for Credentials When Accessing FQDN Sites From a Windows Vista or Windows 7 Computer.

Summary: Edit the registry as described in Microsoft's support document.

Microsoft Support Issue: 968851

Link: <http://support.microsoft.com/kb/968851>

Description: SharePoint Server 2007 Cumulative Update Server Hotfix Package (MOSS server-package): April 30, 2009.

Summary: Apply the fix from Microsoft if you use SharePoint.

Microsoft Support Issue: 2123563

Link: <http://support.microsoft.com/kb/2123563>

Description: You cannot open Office file types directly from a server that supports only Basic authentication over a non-SSL connection.

Summary: Enable SSL encryption on the web server.

Procedure 4.8. To Configure IIS Basic Authentication and Password Replay Support

Follow these steps:

1. Generate and store an encryption key:
 - a. Generate the key using `com.sun.identity.common.DESGenKey` and the `.jar` files where you deployed AM, as in the following example. The Java command below is broken out into multiple lines for display purposes only:

```
$ cd /tomcat/webapps/openam/WEB-INF/lib
$ java -cp forgerock-util-3.0.0.jar:openam-core-14.0.0.jar:\
  openam-shared-14.0.0.jar com.sun.identity.common.DESGenKey
Key ==> sxVoaDRAN0o=
```

Windows users should use semi-colons (";"), instead of colons (":") in the commands. The Java command below is broken out into multiple lines for display purposes only:

```
c:\> cd \tomcat\webapps\openam\WEB-INF\lib
c:\> java -cp forgerock-util-3.0.0.jar;openam-core-14.0.0.jar; ^
  openam-shared-14.0.0.jar com.sun.identity.common.DESGenKey
Key ==> sxVoaDRAN0o=
```

- b. In the AM console navigate to Realms > *Realm Name* > Applications > Agents > Web > *Agent Name* > Advanced > Microsoft IIS Server > Replay Password Key (property name: `com.sun.identity.agents.config.replaypasswd.key`), enter the generated key, and then click Save.

- c. In the AM console, navigate to Deployment > Servers > *Server Name* > Advanced > then add a property `com.sun.am.replaypasswd.key` with the key you generated as the value, and then click Save.
2. In the AM console, navigate to Realms > *Realm Name* > Authentication > Settings > Post Authentication Processing > Authentication Post Processing Classes, then add the class `com.sun.identity.authentication.spi.ReplayPasswd`, and then click Save.
3. If you require Windows logon, or you need to use basic authentication with SharePoint or OWA, then you must configure Active Directory as a user data store, and you must configure the IIS policy agent profile User ID Parameter and User ID Parameter Type so that the policy agent requests AM to provide the appropriate account information from Active Directory in its policy response.

Skip this step if you do not use SharePoint or OWA and no Windows logon is required.

Make sure the AM data store is configured to use Active Directory as the user data store.

In the AM console under Realms > *Realm Name* > Applications > Agents > Web > *Agent Name* > OpenAM Services > Policy Client Service, set User ID Parameter and User ID Parameter Type, and then save your work. For example if the real username for Windows domain logon in Active Directory is stored on the `sAMAccountName` attribute, then set the User ID Parameter to `sAMAccountName`, and the User ID Parameter Type to `LDAP`.

Setting the User ID Parameter Type to `LDAP` causes the policy agent to request that AM get the value of the User ID Parameter attribute from the data store, in this case, Active Directory. Given that information, the policy agent can set the HTTP headers `REMOTE_USER`, `AUTH_USER`, or `LOGON_USER` and `USER_PASSWORD` with Active Directory attribute values suitable for Windows logon, setting the remote user, and so forth.

4. To set the encrypted password in the `AUTH_PASSWORD` header, navigate to Realms > *Realm Name* > Applications > Agents > Web > *Agent Name* > Advanced > Microsoft IIS Server, then select Show Password in HTTP Header, and then click Save.
5. To have the agent perform Windows logon (for user token impersonation), navigate to Realms > *Realm Name* > Applications > Agents > Web > *Agent Name* > Advanced > Microsoft IIS Server, then select Logon and Impersonation, and then click Save.
6. In the AM console, navigate to Realms > *Realm Name* > Applications > Agents > Web > *Agent Name* > Advanced > Microsoft IIS Server, then set Authentication Type to `basic`, and then click Save.
7. To use the agent with SharePoint or Microsoft Office, configure AM to persist the authentication cookie. For details, see "Persistent Cookie Module" in the *ForgeRock Access Management Authentication Guide*.

Chapter 5

Installing Web Policy Agents in NGINX Plus

This chapter covers prerequisites and installation procedures for Web Policy Agents 4.1 into NGINX Plus servers.

5.1. Downloading and Unzipping the Agent

Navigate to the [ForgeRock BackStage](#) website and choose the agent to download based on your version, architecture, and operating system requirements. Remember to verify the checksum of the downloaded file against the checksum posted on the download page.

Unzip the file in the directory where you plan to store the policy agent's configuration and log files. The following directories are extracted:

bin/

Contains the installation and configuration program **agentadmin**.

config/

Contains configuration templates used by the **agentadmin** command during installation.

instances/

Contains configuration files, and audit and debug logs for individual instances of the web policy agents. The directory is empty when first extracted.

legal/

Contains licensing information including third-party licenses.

lib/

Contains shared libraries used by the policy agent.

log/

Contains log files written during installation. The directory is empty when first extracted.

5.2. Before You Install

Consider the following tips before installing web policy agents into NGINX Plus servers:

- Ensure the following directories have read and write permissions for the user or group that is running the NGINX Plus server:

- `/web_agents/nginx12_agent/instances/agent_nnn`
- `/web_agents/nginx12_agent/lib`

Failure to set permissions causes issues such as the NGINX Plus server not starting up, getting a blank page when accessing a protected resource, or errors rotating log files.

- Ensure AM is installed and running, so that you can contact AM from the system running the policy agent.
- The SELinux OS feature can prevent the agents from being able to write to audit and debug logs. See [Chapter 7, "Troubleshooting"](#).

5.3. Installing NGINX Plus Web Policy Agents

Complete the following procedures to install a web policy agent in an NGINX Plus server.

Procedure 5.1. To Complete Pre-Installation Tasks

Perform the following steps to create the configuration required by the policy agent before installing it:

1. Create at least one policy in AM to protect resources with the agent, as described in the procedure *Implementing Authorization Using the Access Management Console*. Consider creating a simple policy, such as a policy that allows only authenticated users to access your resources. This allows you to test your policy agent after installation.
2. Create an agent profile in AM, required by the policy agent to connect and communicate with AM. For more information, see [Section 2.4, "Creating Agent Profiles"](#).
3. Configure your AM instance to support single sign-on (SSO) or cross-domain SSO. Choose one of the following options depending on your environment:

- To configure an AM instance and a policy agent on two different cookie domains, such as `example.org` and `example.net`, set up cross-domain SSO.

For more information, see *Implementing Cross-Domain Single Sign-On*.

- To configure an AM instance and a policy agent on the same cookie domain, such as `example.net`, set up SSO.

For more information, see *Implementing Single Sign-On Within One Domain*.

4. Create a text file containing only the password specified when creating the agent profile, and protect it:

Windows example:

```
C:\> echo password > pwd.txt
```

In Windows Explorer, right-click the password file, for example `pwd.txt`, select Read-Only, and then click OK.

UNIX example:

```
$ echo password > /tmp/pwd.txt
```

```
$ chmod 400 /tmp/pwd.txt
```

Procedure 5.2. To Install the Web Policy Agent into NGINX Plus

1. Check the information in Section 5.2, "Before You Install" before proceeding.
2. Shut down the NGINX Plus server where you plan to install the agent.
3. Make sure AM is running.
4. Run the **agentadmin --i** command to install the agent. You will be prompted to read and accept the software license agreement for the agent installation:

```
$ cd /web_agents/nginx12_agent/bin/  
$ ./agentadmin --i
```

5. When prompted for information, enter the inputs appropriate for your deployment.

Tip

You can cancel the policy agent installation at anytime by pressing **CTRL+C**

- a. Enter the full path to the NGINX Plus server configuration file, `nginx.conf`:

```
Enter the complete path to your NGINX server configuration file  
[ q or 'ctrl+c' to exit ]  
[nginx.conf]: /etc/nginx/nginx.conf
```

- b. The installer can import settings from an existing web policy agent into the new installation and skips prompts for any values present in the existing configuration file. You will be required to re-enter the agent profile password.

Enter the full path to an existing agent configuration file to import the settings, or press **Enter** to skip the import:

```
To set properties from an existing configuration enter path to file  
[ q or 'ctrl+c' to exit, return to ignore ]  
Existing OpenSSOAgentBootstrap.properties file:
```

- c. Enter the full URL of the AM instance this agent should connect to:

```
Enter the URL where the AM server is running. Please include the
deployment URI also as shown below:
(http://openam.sample.com:58080/openam)
[ q or 'ctrl+c' to exit ]
OpenAM server URL: https://openam.example.com:8443/openam
```

- d. Enter the full URL of the server the agent is running on.

```
Enter the Agent URL as shown below:
(http://agent.sample.com:1234)
[ q or 'ctrl+c' to exit ]
Agent URL: http://www.example.com:80
```

- e. Enter the name given to the agent profile created in AM:

```
Enter the Agent profile name
[ q or 'ctrl+c' to exit ]
Agent Profile name: nginx_agent
```

- f. Enter the AM realm containing the agent profile:

```
Enter the Agent realm/organization
[ q or 'ctrl+c' to exit ]
Agent realm/organization name: [/]: /
```

- g. Enter the full path to the file containing the agent profile password created in the prerequisites:

```
Enter the path to a file that contains the password to be used
for identifying the Agent
[ q or 'ctrl+c' to exit ]
The path to the password file: /tmp/pwd.txt
```

- h. The installer displays a summary of the configuration settings you specified.
- If a setting is incorrect, type **no**, or press **Enter**. The installer loops through the configuration prompts again, using your provided settings as the default. Press **Enter** to accept each one, or enter a replacement setting.
 - If the settings are correct, type **yes** to proceed with installation:

```
Installation parameters:

OpenAM URL: https://openam.example.com:8443/openam
Agent URL: http://www.example.com:80
Agent Profile name: nginx_agent
Agent realm/organization name: /
Agent Profile password source: /tmp/pwd.txt

Confirm configuration (yes/no): [no]:yes
Validating...
Validating... Success.

Cleaning up validation data...

Creating configuration...

In order to complete the installation of the agent, update the configuration file /etc/nginx/nginx.conf

if this is the first agent in the installation, please insert the following directives into
the top section of the NGINX configuration
load_module /web_agents/nginx12_agent/lib/openamngx_auth_module.so;

then insert the following directives into the server or location NGINX configuration sections
that you wish this agent to protect:
openam_agent on;
openam_agent_configuration /web_agents/nginx12_agent/instances/agent_1/config/agent.conf;

Please ensure that the agent installation files have read/write permissions for the NGINX
server's user

Please press any key to continue.

Installation complete.
```

The installer sets up configuration and log directories for the agent instance. Each agent instance has its own numbered configuration and logs directories. The first agent is located under the directory `/web_agents/nginx12_agent/instances/agent_1/`.

The configuration files and log locations are as follows:

`config/agent.conf`

Contains the bootstrap properties the web policy agent requires to connect to AM and download its configuration. Also contains properties that are only used if the policy agent is configured to use local configuration.

`logs/audit/`

Audit log directory, used if the `local` or `all` audit locations are enabled.

`logs/debug/`

Debug directory that contains the `debug.log` file. Useful in troubleshooting policy agent issues.

6. Edit the NGINX Plus server configuration file `nginx.conf` to load the policy agent module `openam ngx_auth_module.so`, if it is not already configured:

```
$ vi nginx.conf
user nginx;
worker_processes auto;

error_log /var/log/nginx/error.log notice;
pid /var/run/nginx.pid;
load_module /web_agents/nginx12_agent/lib/openam ngx_auth_module.so;
...
```

7. Edit the NGINX Plus server configuration file containing the context you want to protect and add policy agent directives to it. The following directives are supported:

`openam_agent [on | off]`

Controls if an agent instance is `on` or `off` for a particular `http`, `server`, or `location` context.

- Set the `openam_agent` directive to `on` for a context to protect it and its contents.

If a context already protected requires a specific policy agent configuration, follow the procedures in this section again to create a new policy agent instance for it. The installer will configure the next available policy agent instance, for example, `agent_2`.

- Set the `openam_agent` directive to `off` for a context to disable the policy agent protection for that context and its contents. If the context has a parent, disabling the directive does not affect the protection for the parent.

Consider the following examples:

Example 1

```
server {
    listen      80 default_server;
    server_name localhost;
    openam_agent on;
    openam_agent_configuration /web_agents/nginx12_agent/instances/agent_1/config/agent.conf;
    #charset koi8-r;
    #access_log /var/log/nginx/log/host.access.log main;

    location / {
        root    /www/;
        index   index.html index.htm;
    }

    location /customers {
        openam_agent on;
        openam_agent_configuration /web_agents/nginx12_agent/instances/agent_2/config/agent.conf;
        root    /www/customers
        index   index.html
    }

    location /market {
        root    /www/marketplace
        index   index.html
    }
}
```

The policy agent instance `agent_1` configured at the `server` context is protecting the `/` and `/market` location contexts. The `location` context `/customers` is protected by a second policy agent instance, `agent_2`.

Example 2

```
server {
    listen      80 default_server;
    server_name localhost;
    openam_agent on;
    openam_agent_configuration /web_agents/nginx12_agent/instances/agent_1/config/agent.conf;
    #charset koi8-r;
    #access_log /var/log/nginx/log/host.access.log main;

    location / {
        root    /www/;
        index   index.html index.htm;
    }

    location /customers {
        openam_agent off
        root    /www/customers
        index   index.html
    }

    location /market {
        root    /www/marketplace
        index   index.html
    }
}
```

The policy agent instance `agent_1` is protecting the `server` context and the `/` and `/market` location contexts. Protection is disabled for the `/customers` location context.

`openam_agent_configuration /path/to/agent/config`

Specifies the path to the configuration of the agent instance that protects a context. This directive is mandatory if the `openam_agent` directive is set to `on` for a context.

See the `openam_agent` directive for examples of use.

`openam_agent_instance numeric_value`

Identifies the policy agent installation with a unique numeric value. Set up this directive in the `http` context only if there are multiple NGINX Plus servers installed in the same machine that also have a policy agent installed.

Consider the following example:

```
http {
    include      /etc/nginx/mime.types;
    default_type application/octet-stream;

    openam_agent_instance 1
    ...
}
```

The `openam_agent_instance 1` directive is applied to the `http` context of the first NGINX Plus server. The next NGINX Plus server should configure the next available numeric value, for example, `openam_agent_instance 2`.

The numeric value specified by the directive is not related to the number of policy agent instances configured at any given time.

8. Ensure the user or group that is running the NGINX Plus server has read and write permissions to the following directories:

- `/web_agents/nginx12_agent/instances/agent_nnn`
- `/web_agents/nginx12_agent/lib`

Failure to set permissions causes issues such as the NGINX Plus server not starting up, getting a blank page when accessing a protected resource, or errors rotating log files.

To determine which user or group is running the NGINX Plus server, check the `User` directive in the NGINX Plus server configuration file.

9. Start the NGINX Plus server.

Procedure 5.3. To Check the Policy Agent Installation

1. Check the NGINX Plus logs after starting the server to ensure the startup completed successfully.

By default, the NGINX Plus server logs the startup messages in the operating system's syslog file, for example, `/var/log/messages`. Expected output should resemble the following:

```
Apr 25 02:17:38 tran systemd: Starting NGINX Plus - high performance web server...
Apr 25 02:17:38 FR-server nginx: nginx: the configuration file /etc/nginx/nginx.conf syntax is ok
Apr 25 02:17:38 FR-server nginx: nginx: configuration file /etc/nginx/nginx.conf test is successful
Apr 25 02:17:38 FR-server systemd: Started NGINX Plus - high performance web server.
```

2. Make an HTTP request to a resource protected by the agent, then check the `/web_agents/nginx12_agent/instances/agent_1/logs/debug/debug.log` file to verify that no errors occurred on startup. Expected output should resemble the following:

```
2017-04-25 02:18:05.550 +0100 INFO [0x7f9675063700:9429]

#####
OpenAM Web Agent
Version: 4.1
Revision: 3b116a1
Container: NGINX Plus 12 Linux 64bit
Build date: Apr 20 2017 18:03:17
#####
```

3. (Optional) If you have a policy configured, you can test that your policy agent is processing requests. For example, when you make an HTTP request to a resource protected by the agent, you should be redirected to AM to authenticate. As an example, authenticate as user `demo`, password `changeit`. After you authenticate, AM redirects you back to the resource you tried to access.

5.4. Installing NGINX Plus Web Policy Agents Silently

You can run a silent, non-interactive installation by running **agentadmin --s**, along with arguments used to configure the instance, but you must finish the configuration by running manually steps 6, 7, and 8 of Procedure 5.2, "To Install the Web Policy Agent into NGINX Plus".

The required arguments, and the order in which to specify them are:

Web server configuration file

Enter the full path to the NGINX Plus server configuration file. The installer modifies this file to include the policy agent configuration and module.

OpenAM URL

Enter the full URL of the AM instance the policy agents should connect to. Ensure the deployment URI is specified.

Agent URL

Enter the full URL of the server the agent is running on.

Realm

Enter the AM realm containing the agent profile.

Agent profile name

Enter the name of the agent profile created in AM.

Agent profile password

Enter the full path to the file containing the agent profile password.

--acceptLicence

You can suppress the license agreement prompt during a silent, non-interactive install by including the `--acceptLicence` parameter. The inclusion of the option indicates that you have read and accepted the terms stated in the license. To view the license agreement, open `/path/to/web_agents/agent_type/legal/Forgerock_License.txt`.

--forceInstall

Optionally have the installer proceed with a silent installation even if it cannot connect to the specified AM server during installation, rather than exiting.

Complete the following procedures to install a web policy agent silently into a NGINX Plus server:

Procedure 5.4. To Complete Pre-Installation Tasks

Perform the following steps to create the configuration required by the policy agent before installing it:

1. Create at least one policy in AM to protect resources with the agent, as described in the procedure *Implementing Authorization Using the Access Management Console*. Consider creating a simple policy, such as a policy that allows only authenticated users to access your resources. This allows you to test your policy agent after installation.
2. Create an agent profile in AM, required by the policy agent to connect and communicate with AM. For more information, see Section 2.4, "Creating Agent Profiles".
3. Configure your AM instance to support single sign-on (SSO) or cross-domain SSO. Choose one of the following options depending on your environment:
 - To configure an AM instance and a policy agent on two different cookie domains, such as `example.org` and `example.net`, set up cross-domain SSO.

For more information, see *Implementing Cross-Domain Single Sign-On*.

- To configure an AM instance and a policy agent on the same cookie domain, such as `example.net`, set up SSO.

For more information, see *Implementing Single Sign-On Within One Domain*.

4. Create a text file containing only the password specified when creating the agent profile, and protect it:

Windows example:

```
C:\> echo password > pwd.txt
```

In Windows Explorer, right-click the password file, for example `pwd.txt`, select Read-Only, and then click OK.

UNIX example:

```
$ echo password > /tmp/pwd.txt
```

```
$ chmod 400 /tmp/pwd.txt
```

Procedure 5.5. To install Web Policy Agents in NGINX Plus Silently

1. Check the information in [Section 5.2, "Before You Install"](#) before proceeding.
2. Shut down the NGINX Plus server where you plan to install the agent.
3. Make sure AM is running.
4. Run the **agentadmin --s** command with the required arguments. For example:

```
$ agentadmin --s \  
  "/etc/nginx/nginx.conf" \  
  "https://openam.example.com:8443/openam" \  
  "http://www.example.com:80" \  
  "/" \  
  "nginx_agent" \  
  "/tmp/pwd.txt" \  
  --acceptLicence
```

OpenAM Web Agent for NGINX Server installation.

Validating...

Validating... Success.

Cleaning up validation data...

Creating configuration...

In order to complete the installation of the agent, update the configuration file `/etc/nginx/nginx.conf`

if this is the first agent in the installation, please insert the following directives into the top section of the NGINX configuration

```
load_module /web_agents/nginx12_agent/lib/openam ngx_auth_module.so;
```

```
then insert the following directives into the server or location NGINX configuration sections that you
wish this agent to protect:
openam_agent on;
openam_agent_configuration /web_agents/nginx12_agent/instances/agent_3/config/agent.conf;
```

Please ensure that the agent installation files have read/write permissions for the NGINX server's user

Please press any key to continue.

5. Finish the configuration by performing steps 6, 7, and 8 of [Procedure 5.2, "To Install the Web Policy Agent into NGINX Plus"](#).

5.5. Removing NGINX Plus Web Policy Agents

Complete the following steps to remove an NGINX Plus policy agent:

Procedure 5.6. To remove Web Policy Agents from NGINX Plus Server

1. Shut down the NGINX Plus server where the agent is installed.
2. Run the **agentadmin --l** command to output a list of installed policy agent instances. For example:

```
$ ./agentadmin --l

OpenAM Web Agent configuration instances:

id:          agent_1
configuration: /web_agents/nginx12_agent/instances/agent_1
server/site:  /etc/nginx/nginx.conf

id:          agent_2
configuration: /web_agents/nginx12_agent/instances/agent_2
server/site:  /etc/nginx/nginx.conf

id:          agent_3
configuration: /web_agents/nginx12_agent/instances/agent_3
server/site:  /etc/nginx/nginx.conf
```

Make a note of the ID value of the configuration instance you want to remove.

3. Run the **agentadmin --r** command and specify the ID of the policy agent instance to remove. A warning is displayed. Type **yes** to remove the instance.

```
$ ./agentadmin --r agent_3

Warning! This procedure will remove the OpenAM Web Agent configuration for agent_3
but not references to it your NGINX server configuration file: /etc/nginx/nginx.conf.

Continue (yes/no): [no]: yes

In order to complete the removal of the agent from your NGINX installation,
remove the openam_agent_ directives for this agent
from your NGINX configuration file: /etc/nginx/nginx.conf
and, if this is the only agent in the installation,
remove the load_module directive for the openam_agent_auth_module
in the NGINX configuration file.

Please press any key to continue.

Removing agent_3 configuration... Done.
```

4. Edit the NGINX Plus configuration file that contains the context protected by the removed policy agent instance.
5. Delete the `openam_agent_` directives from the context.

If this is the last agent in the NGINX Plus server, remove the directive that loads the `openamngx_auth_module.so` library.

6. Restart the NGINX Plus server.

Chapter 6

Upgrading Web Policy Agents

The process of upgrading a policy agent consist in uninstalling the old agent and installing a new one. There is no requirement to create a new policy agent profile.

To upgrade Web Policy agents, perform the following procedure:

Procedure 6.1. To Upgrade Web Policy Agents

1. Refer to the [Web Policy Agent Release Notes](#) for information about changes in support and functionality.
2. Back up the policy agent installation and the web server configuration directories. For example:

```
$ cp -r /path/to/web_agents/apache24_agent /path/to/backup
$ cp -r /path/to/apache/httpd/conf /path/to/backup
```

If the configuration is stored centrally in AM, back it up as described in the *ForgeRock Access Management Maintenance Guide*.

3. Redirect client traffic away from the protected web site.
4. Stop the web server where the policy agent is installed.
5. Remove the old policy agent.

For example, to remove an old web policy agent installed in Apache HTTP server, see [Section 3.6, "Removing Apache Web Policy Agents"](#). If the uninstall process has changed, refer to the version of the *Web Policy Agent Guide* that corresponds to your web policy agent.

6. Install the new policy agent.

For example, to install the new policy agent in Apache HTTP server, see [Chapter 3, "Installing Web Policy Agents in Apache HTTP Server"](#).

Provide the `OpenSSOAgentBootstrap.properties` or `agent.conf` files to the installer if you want to reuse bootstrap properties, such as the AM URL, the agent profile name, and others.

The installer creates a new `agent.conf` file containing adequate properties for the particular agent version.

7. Review the agent configuration:

- If the agent configuration is stored in the AM configuration store, review the [Web Policy Agent Release Notes](#) and the [ForgeRock Access Management Release Notes](#) to check what is new and possible changes to AM and the agent. Then, adjust the agent configuration if required using the AM console.
- If the agent configuration is stored locally, review the [Web Policy Agent Release Notes](#), and the [ForgeRock Access Management Release Notes](#) to check what is new and possible changes to AM and the agent. Then, update the `agent.conf` file manually to contain the properties required for your environment. Use the backed-up copy of the configuration file for guidance.

Note

Bootstrap properties created by the installer in the `agent.conf` file are already relevant to the new version of the agent, and should not require modification.

8. Start the web server where the policy agent is installed.
9. Validate that the policy agent is performing as expected.

For example, navigate to a protected page on the web site and confirm whether you can access it according to your configuration.

10. Allow client traffic to flow to the protected web site.

Chapter 7

Troubleshooting

This chapter offers solutions to issues during installation of AM policy agents.

Solutions to Common Issues

This section offers solutions to common problems when installing AM policy agents:

Q: I am trying to install a policy agent on Windows, which will connect to an AM server running over HTTPS, but the installer reports the following:

```
init_ssl(): ssleay32.dll is not available (error: 87)
init_ssl(): libeay32.dll is not available (error: 87)
```

A: If OpenSSL is correctly installed, on Windows 7 or Windows Server 2008 R2 systems, apply the update provided in Microsoft knowledge base article KB2533623. See [Microsoft Security Advisory: Insecure library loading could allow remote code execution](#).

Q: I am trying to install the policy agent on SELinux and I am getting error messages after installation. What happened?

A: SELinux must be properly configured to connect the web policy agent and AM nodes. Either re-configure SELinux or disable it, then reinstall the policy agent.

Q: My Apache HTTP server is not using port 80. But when I install the web policy agent it defaults to port 80. How do I fix this?

A: You probably set `ServerName` in the Apache HTTP Server configuration to the host name, but did not specify the port number.

Instead you must set both the host name and port number for `ServerName` in the configuration. For example, if you have Apache HTTP Server configured to listen on port 8080, then set `ServerName` appropriately as in the following excerpt:

```
<VirtualHost *:8080>
ServerName www.localhost.example:8080
```

Q: My web server and web policy agent are installed as root, and the agent cannot rotate logs. I am seeing this error:

```
Could not rotate log file ... (error: 13)
```

What should I do?

- A:** First, avoid installing the web server (and therefore also the web policy agent) as root, but instead create a web server user and install as that user.

If however you cannot avoid installing the web server and policy agent as root, then you must give all users read and write permissions to the `logs/` directory under the agent instance directory (`/web_agents/agent_version/instances/agent_nnn/logs/`). Otherwise, the web policy agent fails to rotate log files with the error you observed.

- Q:** How do I increase security against possible phishing attacks through open redirect?

- A:** You can specify a list of valid URL resources against which AM validates the `goto` and `gotoOnFail` URL using the Valid `goto` URL Resource service.

AM only redirects a user if the `goto` and `gotoOnFail` URL matches any of the resources specified in this setting. If no setting is present, it is assumed that the `goto` and `gotoOnFail` URL is valid.

To set the Valid `goto` URL Resources, use the AM console, and navigate to Realms > *Realm Name* > Services. Click Add, select Validation Service, and then add one or more valid `goto` URLs.

You can use the `"*"` wildcard to define resources, where `"*"` matches all characters except `"?"`. For example, you can use the wildcards, such as `https://website.example.com/*` or `https://website.example.com/*?*`. For more specific patterns, use resource names with wildcards as described in the procedure, *Constraining Post-Login Redirects*.

Chapter 8

Reference

8.1. Configuring Web Policy Agent Properties

When you create a web policy agent profile and install the agent, you can choose to store the agent configuration centrally and configure the agent using the AM console. Alternatively, you can choose to store the agent configuration locally and configure the agent by changing values in the properties file. This section covers centralized configuration, indicating the corresponding properties for use in a local configuration file where applicable.¹

Some properties do not yet appear in the AM console, so they need to be configured as custom properties, see Section 8.1.7, "Configuring Web Policy Agent Custom Properties", or locally in the agent properties configuration file, `agent.conf`.

Tip

To show the agent properties in configuration file format that correspond to what you see in the console, click Export Configuration after editing agent properties.

This corresponds to the local Java properties configuration file that is set up when you install an agent, for example in `agent_1/config/agent.conf`.

After changing properties specified as "Hot swap: no", you must restart the agent's container for the changes to take effect.

8.1.1. Configuring Web Policy Agent Global Properties

This section covers global web agent properties. After creating the agent profile, you access these properties in the AM console under Realms > *Realm Name* > Applications > Agents > Web > *Agent Name* > Global.

This section describes the following property groups:

- Profile Properties
- General Properties
- Audit Properties
- Fully Qualified Domain Name Checking Properties

¹ The configuration file syntax is that of a standard Java properties file. See `java.util.Properties.load` for a description of the format. The value of a property specified multiple times is not defined.

Profile Properties

Group

`agentgroup`

For assigning the agent to a previously configured web agent group in order to inherit selected properties from the group.

Property: `agentgroup`

Password

Agent password used when creating the password file and when installing the agent.

Property: `userpassword`

Status

Status of the agent configuration.

Property: `sunIdentityServerDeviceStatus`

Location of Agent Configuration Repository

Whether the agent's configuration is managed centrally through AM (`centralized`) or locally in the policy agent configuration file (`local`).

If you change this to a local configuration, you can no longer manage the policy agent configuration through the AM console.

Property: `com.sun.identity.agents.config.repository.location`

Agent Configuration Change Notification

Enable agent to receive notification messages from AM server for configuration changes.

Property: `com.sun.identity.agents.config.change.notification.enable`

Enable Notifications

If enabled, the agent receives policy updates from the AM notification mechanism to maintain its internal cache. If disabled, the agent must poll AM for changes.

Property: `com.sun.identity.agents.config.notification.enable`

Hot swap: no

Agent Notification URL

URL used by agent to register notification listeners.

Property: `com.sun.identity.client.notification.url`

Hot swap: no

Agent Deployment URI Prefix

The default value is `agent-root-URL/amagent`.

Property: `com.sun.identity.agents.config.agenturi.prefix`

Hot swap: yes

Configuration Reload Interval

Interval in minutes to fetch agent configuration from AM. Used if notifications are disabled.
Default: 60.

Property: `com.sun.identity.agents.config.polling.interval`

Hot swap: no

Configuration Cleanup Interval

Interval in minutes to cleanup old agent configuration entries unless they are referenced by current requests. Default: 30.

Property: `com.sun.identity.agents.config.cleanup.interval`

Hot swap: no

Agent Root URL for CDSSO

The agent root URLs for CDSSO. The valid value is in the format `protocol://hostname:port/` where `protocol` represents the protocol used, such as `http` or `https`, `hostname` represents the host name of the system where the agent resides, and `port` represents the port number on which the agent is installed. The slash following the port number is required.

If your agent system also has virtual host names, add URLs with the virtual host names to this list as well. AM checks that the `goto` URLs match one of the agent root URLs for CDSSO.

Property: `sunIdentityServerDeviceKeyValue[n]=protocol://hostname:port/`

General Properties

SSO Only Mode

When enabled, the agent enforces authentication, so that upon verification of the user's identity, the user receives a session token.

When `true`, the web policy agent only manages user authentication. The filter invokes the AM Authentication Service to verify the identity of the user. If the user's identity is verified, the user is issued a session token through AM's Session Service.

When `false`, which is the default, the web policy agents will also manage user authorization, by using the policy engine in AM.

Property: `com.sun.identity.agents.config.sso.only`

Resources Access Denied URL

The URL of the customized access denied page. If no value is specified (default), then the agent returns an HTTP status of 403 (Forbidden). The URL can be absolute or relative.

The following are not permitted in the URL:

- Wildcards
- The `.` directory specifier
- The `..` directory specifier

Property: `com.sun.identity.agents.config.access.denied.url`

Agent Debug Level

Default is `Error`. Increase to `Message` or even `All` for fine-grained detail.

Valid values for the property are:

- All
- Error
- Info
- Message
- Warning

Property: `com.sun.identity.agents.config.debug.level`

Agent Debug File Rotation

When enabled, rotate the debug file when specified file size is reached.

Property: `com.sun.identity.agents.config.debug.file.rotate`

Agent Debug File Size

Debug file size in bytes beyond which the log file is rotated. The minimum is 5242880 bytes (5 MB), and lower values are reset to 5 MB. AM sets a default of 10000000 bytes (approximately 10 MB).

Tip

If `com.sun.identity.agents.config.debug.file.rotate` is enabled, setting `com.sun.identity.agents.config.debug.file.size` to `-1` in the `agent.conf` file will rotate debug log files once every 24 hours rather than at a specified size limit.

Property: `com.sun.identity.agents.config.debug.file.size`

Default: 10000000

`com.sun.identity.agents.config.local.logfile` (Not yet in the AM console)

Name of file stored locally on the agent that contains agent debug messages.

Default:

```
/web_agents/agent_version/instances/agent_nnn/logs/debug/debug.log
```

Audit Properties

Audit Access Types

Types of messages to log based on user URL access attempts.

Property: `com.sun.identity.agents.config.audit.accesstype`

Valid values for the configuration file property include `LOG_NONE`, `LOG_ALLOW`, `LOG_DENY`, and `LOG_BOTH`.

Audit Log Location

Specifies where audit messages are logged. By default, audit messages are logged remotely.

Property: `com.sun.identity.agents.config.log.disposition`

Valid values for the configuration file property include `REMOTE`, `LOCAL`, and `ALL`.

Remote Log Filename

Name of the file stored on AM that contains agent audit messages when Audit Log Location is set to `REMOTE` or `ALL`.

Property: `com.sun.identity.agents.config.remote.logfile`

Hot swap: no

Remote Audit Log Interval

Periodic interval in minutes in which audit log messages are sent to the remote log file.

Property: `com.sun.identity.agents.config.remote.log.interval`

Default: 5

Hot swap: no

Rotate Local Audit Log

When enabled, audit log files are rotated when reaching the specified size.

Property: `com.sun.identity.agents.config.local.log.rotate`

Local Audit Log Rotation Size

Beyond this size limit in bytes, the agent rotates the local audit log file if rotation is enabled. The minimum is 5242880 bytes (5 MB), and lower values are reset to 5 MB. AM sets a default of 52428800 bytes (50 MB).

Property: `com.sun.identity.agents.config.local.log.size`

Default: 52428800

`com.sun.identity.agents.config.local.audit.logfile` (Not yet in the AM console)

Name of file stored locally on the agent that contains agent audit messages if log location is LOCAL or ALL.

Default:

```
/web_agents/agent_version/instances/agent_nnn/logs/audit/audit.log
```

Fully Qualified Domain Name Checking Properties

FQDN Check

Enables checking of FQDN default value and FQDN map values.

Property: `com.sun.identity.agents.config.fqdn.check.enable`

FQDN Default

FQDN that the users should use in order to access resources. Without this value, the web server can fail to start, thus you set the property on agent installation, and only change it when absolutely necessary.

This property ensures that when users access protected resources on the web server without specifying the FQDN, the agent can redirect the users to URLs containing the correct FQDN.

Property: `com.sun.identity.agents.config.fqdn.default`

FQDN Virtual Host Map

Enables virtual hosts, partial hostname, and IP address to access protected resources. Maps invalid or virtual name keys to valid FQDN values so the agent can properly redirect users and the agents receive cookies belonging to the domain.

To map a virtual server `virtual.example.com` to `real.mydomain.example`, enter the keyword `validn`, where `n` is an incrementing integer starting at `1`, in the Map Key field. Enter `virtual.example.com` in the Corresponding Map Value field.

In the configuration file, this corresponds to `com.sun.identity.agents.config.fqdn.mapping[valid1]=virtual.example.com`.

To map `myserver` to `myserver.mydomain.example`, enter `myserver` in the Map Key field, and enter `myserver.mydomain.example` in the Corresponding Map Value field. This corresponds to `com.sun.identity.agents.config.fqdn.mapping[myserver]=myserver.mydomain.example`.

Invalid FQDN values can cause the web server to become unusable or render resources inaccessible.

Property: `com.sun.identity.agents.config.fqdn.mapping[Source hostname / IP address]=Target FQDN`

8.1.2. Configuring Web Policy Agent Application Properties

This section covers application web agent properties. After creating the agent profile, you access these properties in the AM console under Realms > *Realm Name* > Applications > Agents > Web > *Agent Name* > Application.

This section describes the following property groups:

- Not Enforced URL Processing Properties
- Not Enforced IP Processing Properties
- Not Enforced URL from IP Processing Properties (Not yet in the AM console)
- Profile Attributes Processing Properties
- Response Attributes Processing Properties
- Session Attributes Processing Properties
- Common Attributes Fetching Processing Properties

Not Enforced URL Processing Properties

Ignore Path Info for Not Enforced URLs

When enabled, the path info and query are stripped from the request URL before being compared with the URLs of the not enforced list for those URLs containing a wildcard character. This prevents a user from accessing `http://host/index.html` by requesting `http://host/index.html/hack.gif` when the not enforced list includes `http://host/*.gif`.

For more information about Ignore Path Info, see Ignore Path Info Properties.

Note

The NGINX web policy agent does not support this setting.

Property: `com.sun.identity.agents.config.ignore.path.info.for.not.enforced.list`

Enable Regular Expressions for Not Enforced URLs (Not yet in the AM console)

Enable use of Perl-compatible regular expressions in Not Enforced URL settings by using the following property under Advanced > Custom Properties in the agent profile.

Property: `com.forgerock.agents.notenforced.url.regex.enable`

Not Enforced URLs

List of URLs for which no authentication is required. You can use wildcards to define a pattern for a URL.

The `*` wildcard matches all characters except question mark (`?`), cannot be escaped, and spans multiple levels in a URL. Multiple forward slashes do not match a single forward slash, so `*` matches `mult/iple/dirs`, yet `mult/*/dirs` does not match `mult/dirs`.

The `-*` wildcard matches all characters except forward slash (`/`) or question mark (`?`), and cannot be escaped. As it does not match `/`, `-*` does not span multiple levels in a URL. The `-*` wildcard can only be used in the path sections of a URL, not within the host, port, or protocol sections.

AM does not let you mix `*` and `-*` in the same URL.

Examples include `http://www.example.com/logout.html`, `http://www.example.com/images/*`, `http://www.example.com/css/-*`, and `http://www.example.com/*.jsp?locale=*`.

Trailing forward slashes are not recognized as part of a resource name. Therefore `http://www.example.com/images//` and `http://www.example.com/images` are equivalent.

Property: `com.sun.identity.agents.config.notenforced.url[n]=Not enforced URL pattern`

If you enabled use of Perl-compatible regular expressions to match Not Enforced URLs, then all your settings must be done using regular expressions. (Do not mix settings; use either the mechanism described above or Perl-compatible regular expressions, but not both.)

The following example shows settings where no authentication is required for URLs whose path ends `/PublicServletA` or `/PublicServletB` (with or without query string parameters), and no authentication is required to access `.png`, `.jpg`, `.gif`, `.js`, or `.css` files under URLs that do not contain `/protectedA/` or `/protectedB/`.

```
com.sun.identity.agents.config.notenforced.url[0]=.*/(PublicServletA|PublicServletB)(\?.*|$)
com.sun.identity.agents.config.notenforced.url[1]=^(?!.*(protectedA|protectedB)).*\.(png|jpg|gif|js|css)(\?.*|$)
```

Invert Not Enforced URLs

Only invert the Not Enforced list of URLs. In other words, enforce policy only for those URLs and patterns specified in the list.

Property: `com.sun.identity.agents.config.notenforced.url.invert`

Fetch Attributes for Not Enforced URLs

When enabled, the agent fetches profile, response, and session attributes that are mapped by doing policy evaluation, and forwards these attributes to not enforced URLs.

Property: `com.sun.identity.agents.config.notenforced.url.attributes.enable`

Not Enforced IP Processing Properties

Not Enforced Client IP List

No authentication and authorization are required for the requests coming from these client IP addresses.

Individual IP Address Example

To disable policy agent enforcement for addresses 192.18.145.128 and 192.18.146.123, use the following setting:

```
com.sun.identity.agents.config.notenforced.ip[0]=192.18.145.128
com.sun.identity.agents.config.notenforced.ip[1]=192.18.146.123
```

Netmask Example

To disable policy agent enforcement for addresses in 192.168.1.1 to 192.168.1.255, use the following setting:

```
com.sun.identity.agents.config.notenforced.ip = 192.168.1.1/24
```

The following example shows an IPv6 address with a corresponding network mask.

```
com.sun.identity.agents.config.notenforced.ip = 2001:5c0:9168:0:0:0:0:2/128
```

Currently the policy agent stops evaluating properties after reaching an invalid netmask in the list.

IP Range Example

To disable policy agent enforcement for addresses between 192.168.1.1 to 192.168.4.3 inclusive, use the following setting:

```
com.sun.identity.agents.config.notenforced.ip = 192.168.1.1-192.168.4.3
```

The following example shows a range of IPv6 addresses. The example is displayed over two lines for formatting purposes.

```
com.sun.identity.agents.config.notenforced.ip = \
2001:5c0:9168:0:0:0:0:1-2001:5c0:9168:0:0:0:0:2
```

Property: `com.sun.identity.agents.config.notenforced.ip[n]=Not enforced IP pattern`

Note

Loopback addresses are not considered valid IPs on the Not Enforced IP list. If specified, the policy agent ignores the loopback address.

Client IP Validation

When enabled, validate that the subsequent browser requests come from the same IP address that the SSO token is initially issued against.

Property: `com.sun.identity.agents.config.client.ip.validation.enable`

Not Enforced URL from IP Processing Properties (Not yet in the AM console)

`org.forgerock.agents.config.notenforced.ipurl[n]`

No authentication and authorization are required for requests coming from specified client IP addresses that are requesting specified resource URLs.

Specify a list of IP addresses separated by spaces, the pipe (|) character, and a list of URLs separated by spaces.

The IP list can be specified by using either netmask or IP range notation:

Netmask Example

To specify requests coming from addresses in the range 192.168.1.1 to 192.168.1.255, use the following setting.

```
192.168.1.1/24
```

The following example shows an IPv6 address with a corresponding network mask.

```
2001:5c0:9168:0:0:0:0:2/128
```

IP Range Example

To specify requests coming from addresses in the range 192.168.1.1 to 192.168.4.3 inclusive, use the following setting.

```
192.168.1.1-192.168.4.3
```

The following example shows a range of IPv6 addresses.

```
2001:5c0:9168:0:0:0:0:1-2001:5c0:9168:0:0:0:0:2
```

The URL list can be specified by using wildcards (*) or regular expressions. To use regular expression matches in the URL list, set `org.forgerock.agents.config.notenforced.ext.regex.enable=true`. Do not mix using wildcards and regular expressions. Multiple values should be separated by space characters.

The following example will not require authentication or authorization for any requests coming from the specified IP addresses, when also requesting access to a `/reports` URL, or certain files under the `/images` URL. The example is displayed over three lines for formatting purposes.

```
org.forgerock.agents.config.notenforced.ipurl[0]= \
10.1.2.1-10.1.2.7|/reports ^(?=.*(images/)).*\.(png|jpg|gif)(\?.*|$)
org.forgerock.agents.config.notenforced.ext.regex.enable=true
```

`org.forgerock.agents.config.notenforced.ext.regex.enable`

Enable use of Perl-compatible regular expressions in Not Enforced URL from IP settings.

Profile Attributes Processing Properties

Profile Attribute Fetch Mode

When set to `HTTP_COOKIE` or `HTTP_HEADER`, profile attributes are introduced into the cookie or the headers, respectively.

Property: `com.sun.identity.agents.config.profile.attribute.fetch.mode`

Profile Attribute Map

Maps the profile attributes to HTTP headers for the currently authenticated user. Map keys are LDAP attribute names, and map values are HTTP header names.

To populate the value of profile attribute CN under `CUSTOM-Common-Name`, enter CN in the Map Key field, and enter `CUSTOM-Common-Name` in the Corresponding Map Value field. This corresponds to `com.sun.identity.agents.config.profile.attribute.mapping[cn]=CUSTOM-Common-Name`.

In most cases, in a destination application where an HTTP header name shows up as a request header, it is prefixed by `HTTP_`, lower case letters become upper case, and hyphens (-) become underscores (_). For example, `common-name` becomes `HTTP_COMMON_NAME`.

Property: `com.sun.identity.agents.config.profile.attribute.mapping`

Response Attributes Processing Properties

Response Attribute Fetch Mode

When set to `HTTP_COOKIE` or `HTTP_HEADER`, response attributes are introduced into the cookie or the headers, respectively.

Property: `com.sun.identity.agents.config.response.attribute.fetch.mode`

Response Attribute Map

Maps the policy response attributes to HTTP headers for the currently authenticated user. The response attribute is the attribute in the policy response to be fetched.

To populate the value of response attribute `uid` under `CUSTOM-User-Name`: enter `uid` in the Map Key field, and enter `CUSTOM-User-Name` in the Corresponding Map Value field. This corresponds to `com.sun.identity.agents.config.response.attribute.mapping[uid]=Custom-User-Name`.

In most cases, in a destination application where an HTTP header name shows up as a request header, it is prefixed by `HTTP_`, lower case letters become upper case, and hyphens (-) become underscores (_). For example, `response-attr-one` becomes `HTTP_RESPONSE_ATTR_ONE`.

Property: `com.sun.identity.agents.config.response.attribute.mapping[Response attribute]=HTTP header`

Session Attributes Processing Properties

Session Attribute Fetch Mode

When set to `HTTP_COOKIE` or `HTTP_HEADER`, session attributes are introduced into the cookie or the headers, respectively.

Property: `com.sun.identity.agents.config.session.attribute.fetch.mode`

Session Attribute Map

Maps session attributes to HTTP headers for the currently authenticated user. The session attribute is the attribute in the session to be fetched.

To populate the value of session attribute `UserToken` under `CUSTOM-userid`: enter `UserToken` in the Map Key field, and enter `CUSTOM-userid` in the Corresponding Map Value field. This corresponds to `com.sun.identity.agents.config.session.attribute.mapping[UserToken]=CUSTOM-userid`.

In most cases, in a destination application where an HTTP header name shows up as a request header, it is prefixed by `HTTP_`, lower case letters become upper case, and hyphens (-) become underscores (_). For example, `success-url` becomes `HTTP_SUCCESS_URL`.

Property: `com.sun.identity.agents.config.session.attribute.mapping[Session attribute]=HTTP header`

Common Attributes Fetching Processing Properties

Attribute Multi-Value Separator

Specifies separator for multiple values. Applies to all types of attributes, such as profile, session, and response attributes. Default: `|`.

Property: `com.sun.identity.agents.config.attribute.multi.value.separator`

8.1.3. Configuring Web Policy Agent SSO Properties

This section covers SSO web agent properties. After creating the agent profile, you access these properties in the AM console under Realms > *Realm Name* > Applications > Agents > Web > *Agent Name* > SSO.

This section describes the following property groups:

- Cookie Properties
- Cross Domain SSO Properties
- Cookie Reset Properties

Cookie Properties

Cookie Name

Name of the SSO token cookie used between the AM server and the agent. Default: `iPlanetDirectoryPro`.

Property: `com.sun.identity.agents.config.cookie.name`

Hot swap: no

Cookie Security

When enabled, the agent marks cookies secure, sending them only if the communication channel is secure.

Property: `com.sun.identity.agents.config.cookie.secure`

Hot swap: no

HTTPOnly Cookies (Not yet in the AM console)

Agents with this property set to `true` mark cookies as HTTPOnly to prevent scripts and third-party programs from accessing the cookies.

Property: `com.sun.identity.cookie.httponly`

Cross Domain SSO Properties

Cross Domain SSO

Enables cross-domain single sign-on (CDSSO) for AM deployments that use stateful sessions. CDSSO is not supported for AM deployments that use stateless sessions.

Property: `com.sun.identity.agents.config.cdsso.enable`

CDSSO Servlet URL

List of URLs of the available CDSSO controllers that the agent can use for CDSSO processing. For example, `http://openam.example.com:8080/openam/cdcservlet`.

Property: `com.sun.identity.agents.config.cdsso.cdcservlet.url[n]=Servlet URL`

Cookies Domain List

List of domains, such as `.example.com`, in which cookies have to be set in CDSSO. If this property is left blank, then the fully qualified domain name of the cookie for the agent server is used to set the cookie domain, meaning that a host cookie rather than a domain cookie is set.

To set the list to `.example.com`, and `.example.net` using the configuration file property, include the following.

```
com.sun.identity.agents.config.cdsso.cookie.domain[0]=.example.com
com.sun.identity.agents.config.cdsso.cookie.domain[1]=.example.net
```

Property: `com.sun.identity.agents.config.cdsso.cookie.domain[n]=Cookie domain`

Cookie Reset Properties

Cookie Reset

When enabled, agent resets cookies in the response before redirecting to authentication.

Property: `com.sun.identity.agents.config.cookie.reset.enable`

Cookie Reset Name List

List of cookies in the format `name[=value][;Domain=value]`.

Concrete examples include the following with two list items configured.

- `LtpaToken`, corresponding to `com.sun.identity.agents.config.cookie.reset[0]=LtpaToken`. The default domain is taken from FQDN Default.
- `token=value;Domain=subdomain.domain.com`, corresponding to `com.sun.identity.agents.config.cookie.reset[0]=token=value;Domain=subdomain.domain.com`

Property: `com.sun.identity.agents.config.cookie.reset[n]=List of cookies`

8.1.4. Configuring Access Management Services Properties

This section covers AM services web agent properties. After creating the agent profile, you access these properties in the AM console under Realms > *Realm Name* > Applications > Agents > Web > *Agent Name* > OpenAM Services.

This section describes the following property groups:

- Login URL Properties
- Logout URL Properties
- Agent Logout URL Properties
- Policy Client Service Properties

Login URL Properties

OpenAM Login URL

AM login page URL, such as `http://openam.example.com:8080/openam/UI/Login`, to which the agent redirects incoming users without sufficient credentials so that they can authenticate.

Property: `com.sun.identity.agents.config.login.url[n]=AM Login URL`

OpenAM Conditional Login URL (Not yet in the AM console)

To conditionally redirect users based on the incoming request URL, set this property.

This takes the incoming request domain to match, a vertical bar (`|`), and then a comma-separated list of URLs to which to redirect incoming users.

If the domain before the vertical bar matches an incoming request URL, then the policy agent uses the list of URLs to determine how to redirect the user-agent. If the global property FQDN Check (`com.sun.identity.agents.config.fqdn.check.enable`) is enabled for the policy agent, then the policy agent iterates through the list until it finds an appropriate redirect URL that matches the FQDN check. Otherwise, the policy agent redirects the user-agent to the first URL in the list.

Property: `com.forgerock.agents.conditional.login.url[n]`

Examples:

```
com.forgerock.agents.conditional.login.url[0]=login.example.com|http://openam1.example.com/openam/UI/Login, http://openam2.example.com/openam/UI/Login
```

```
com.forgerock.agents.conditional.login.url[1]=signin.example.com|http://openam3.example.com/openam/UI/Login, http://openam4.example.com/openam/UI/Login
```

If CDSSO is enabled for the policy agent, then this property takes CDSSO Servlet URLs for its values (`com.sun.identity.agents.config.cdssso.cdcservlet.url`), rather than AM login URLs.

CDSSO examples:

```
com.forgerock.agents.conditional.login.url[0]=login.example.com|http://openam1.example.com/openam/cdcservlet, http://openam2.example.com/openam/cdcservlet
```

```
com.forgerock.agents.conditional.login.url[1]=signin.example.com|http://openam3.example.com/openam/cdcservlet, http://openam4.example.com/openam/cdcservlet
```

Regular Expression Conditional Login URL (Not yet in the AM console)

Conditionally redirect users based on the incoming request URL, which is specified by a regular expression. If the incoming URL matches the regular expression, the policy agent determines the appropriate redirection URL from a comma-separated list of URLs.

When configuring this module, consider the following points:

- If the global property FQDN Check `com.sun.identity.agents.config.fqdn.check.enable` is enabled, the policy agent iterates through the list of URLs until it finds an appropriate redirect URL that matches the FQDN check. Otherwise, the policy agent redirects the user to the first URL in the list.
- If CDSO is enabled, configure the list of URLs so it takes CDSO servlet URLs as defined in the `com.sun.identity.agents.config.cdsso.cdcservlet.url` property, rather than AM login URLs.

Properties:

```
org.forgerock.agents.config.conditional.login.pattern[n]
org.forgerock.agents.config.conditional.login.url[n]
```

Examples:

```
org.forgerock.agents.config.conditional.login.pattern[0] = .*shop
org.forgerock.agents.config.conditional.login.url[0] = http://openam3.example.com/openam/UI/
Login,http://openam3.example.com/openam/UI/Login
```

CDSO examples:

```
org.forgerock.agents.config.conditional.login.pattern[0] = .*shop
org.forgerock.agents.config.conditional.login.url[0] = http://openam3.example.com/openam/
cdcservlet,http://openam4.example.com/openam/cdcservlet
```

Note

These properties are supported for the NGINX Plus web policy agent only.

Agent Connection Timeout

Timeout period in seconds for an agent connection with AM auth server.

Property: `com.sun.identity.agents.config.auth.connection.timeout`

Default: 2

Polling Period for Primary Server

Interval in minutes, agent polls to check the primary server is up and running. Default: 5.

Property: `com.sun.identity.agents.config.poll.primary.server`

Hot swap: no

Logout URL Properties

OpenAM Logout URL

AM logout page URLs, such as `http://openam.example.com:8080/openam/UI/Logout`.

Property: `com.sun.identity.agents.config.logout.url[n]=AM logout URL`

Enable Logout URL Redirect (Not yet in the AM console)

Logout URL redirect is enabled by default.

When this is disabled, instead of redirecting the user-agent, the policy agent performs session logout in the background and then continues processing access to the current URL. Disable this using Advanced > Custom Properties in the agent profile.

Property: `com.forgerock.agents.config.logout.redirect.disable`

Agent Logout URL Properties

Logout URL List

List of application logout URLs, such as `http://www.example.com/logout.html`. The user is logged out of the AM session when these URLs are accessed. When using this property, specify a value for the Logout Redirect URL property.

Property: `com.sun.identity.agents.config.agent.logout.url[n]=Agent logout URL`

Agent Logout URL Regular Expression (Not yet in the AM console)

Perl-compatible regular expression that matches logout URLs. Set this using Advanced > Custom Properties in the agent profile.

For example, to match URLs with `protectedA` or `protectedB` in the path and `op=logout` in the query string, use the following setting:

```
com.forgerock.agents.agent.logout.url.regex= \
*/(protectedA\?|/protectedB\?/).*(&op=logout&)(.*|$)
```

When you use this property, the agent ignores the settings for Logout URL List.

Logout Cookies List for Reset

Cookies to be reset upon logout in the same format as the cookie reset list.

List of cookies to be reset upon logout in the format: `name[=value][;Domain=value]`.

For example `Cookie2=value;Domain=subdomain.domain.com`, which equates to: `com.sun.identity.agents.config.logout.cookie.reset[0]=Cookie2=value;Domain=subdomain.domain.com`

Property: `com.sun.identity.agents.config.logout.cookie.reset[n]=List of cookies`

Logout Redirect URL

User gets redirected to this URL after logout. Specify this property alongside a Logout URL List.

Property: `com.sun.identity.agents.config.logout.redirect.url`

Policy Client Service Properties

Policy Cache Polling Period

Polling interval in minutes during which an entry remains valid after being added to the agent's cache.

Property: `com.sun.identity.agents.config.policy.cache.polling.interval`

Hot swap: no

SSO Cache Polling Period

Polling interval in minutes during which an SSO entry remains valid after being added to the agent's cache.

Property: `com.sun.identity.agents.config.sso.cache.polling.interval`

Hot swap: no

User ID Parameter

Agent sets this value for User Id passed in the session from AM to the `REMOTE_USER` server variable.
Default: `UserToken`.

Property: `com.sun.identity.agents.config.userid.param`

User ID Parameter Type

User ID can be fetched from either SESSION or LDAP attributes. Default: `SESSION`.

Property: `com.sun.identity.agents.config.userid.param.type`

Fetch Policies From The Root Resource

When enabled, the agent caches the policy decision of the resource and all resources from the root of the resource down. For example, if the resource is `http://host/a/b/c`, then the root of the resource is `http://host/`. This setting can be useful when a client is expect to access multiple resources on the same path. Yet, caching can be expensive if very many policies are defined for the root resource.

Property: `com.sun.identity.agents.config.fetch.from.root.resource`

Default: false

Hot swap: no

Retrieve Client Hostname

When enabled, get the client hostname through DNS reverse lookup for use in policy evaluation. This setting can impact performance.

Property: `com.sun.identity.agents.config.get.client.host.name`

Policy Clock Skew

Time in seconds used adjust time difference between agent system and AM. Clock skew in seconds = AgentTime - AMServerTime.

Use this property to adjust for small time differences encountered despite use of a time-synchronization service. When this property is not set and agent time is greater than AM server time, the agent can make policy calls to the AM server before the policy subject cache has expired, or you can see infinite redirection occur.

Property: `com.sun.identity.agents.config.policy.clock.skew`

Hot swap: no

Realm

Realm where AM starts policy evaluation for this policy agent.

Default: `/` (top-level realm)

Edit this property when AM should start policy evaluation in a realm other than the top-level realm, `/`, when handling policy decision requests from this policy agent.

This property is recognized by AM, not the policy agent.

Property: `org.forgerock.openam.agents.config.policy.evaluation.realm`

Hot swap: yes

Application

Application where AM looks for policies to evaluate for this policy agent.

Default: `iPlanetAMWebAgentService`

Edit this property when AM should look for policies that belong to an application other than `iPlanetAMWebAgentService` when handling policy decision requests from this policy agent.

This property is recognized by AM, not the policy agent.

Property: `org.forgerock.openam.agents.config.policy.evaluation.application`

Hot swap: yes

8.1.5. Configuring Web Policy Agent Miscellaneous Properties

This section covers miscellaneous web agent properties. After creating the agent profile, you access these properties in the AM console under Realms > *Realm Name* > Applications > Agents > Web > *Agent Name* > Miscellaneous.

This section describes the following property groups:

- Advice Handling Properties
- Locale Properties
- Anonymous user Properties
- Cookie Processing Properties
- URL Handling Properties
- Ignore Naming URL Properties
- Invalid URL properties (Not yet in the AM console)
- Ignore Server Check Properties
- Ignore Path Info Properties
- Multi-Byte Enable Properties
- Goto Parameter Name Properties
- Deprecated Agent Properties

Advice Handling Properties

Composite Advice Handling (Not yet in the AM console)

As of version 3.0.4, when set to `true`, the agent sends composite advice in the query (GET request) instead of sending it through a POST request.

Property: `com.sun.am.use_redirect_for_advice`

Locale Properties

Agent Locale

The default locale for the agent.

Property: `com.sun.identity.agents.config.locale`

Hot swap: no

Anonymous user Properties

Anonymous User

Enable or disable REMOTE_USER processing for anonymous users.

Property: `com.sun.identity.agents.config.anonymous.user.enable`

Cookie Processing Properties

Encode special characters in Cookies

When enabled, use URL encoding for special characters in cookies. This is useful when profile, session, and response attributes contain special characters, and the attributes fetch mode is set to `HTTP_COOKIE`.

Property: `com.sun.identity.agents.config.encode.cookie.special.chars.enable`

Profile Attributes Cookie Prefix

Sets cookie prefix in the attributes headers. Default: `HTTP_`.

Property: `com.sun.identity.agents.config.profile.attribute.cookie.prefix`

Profile Attributes Cookie Maxage

Maximum age in seconds of custom cookie headers. Default: 300.

Property: `com.sun.identity.agents.config.profile.attribute.cookie.maxage`

URL Handling Properties

URL Comparison Case Sensitivity Check

When enabled, enforces case insensitivity in both policy and not enforced URL evaluation.

Property: `com.sun.identity.agents.config.url.comparison.case.ignore`

Encode URL's Special Characters

When enabled, encodes the URL which has special characters before doing policy evaluation.

Property: `com.sun.identity.agents.config.encode.url.special.chars.enable`

Ignore Naming URL Properties

Ignore Preferred Naming URL in Naming Request

When enabled, do not send a preferred naming URL in the naming request.

Property: `com.sun.identity.agents.config.ignore.preferred.naming.url`

Invalid URL properties (Not yet in the AM console)

Invalid URL Regular Expression

Use a Perl-compatible regular expression to filter out invalid request URLs. The policy agent rejects requests to invalid URLs with HTTP 403 Forbidden status without further processing. Use Advanced > Custom Properties to set this in the agent profile.

For example, to filter out URLs containing the symbols in the list `./, /., /, ., \, %00-%1f, %7f-%ff, %25, %2B, %2C, %7E, .info`, use the following setting.

```
com.forgerock.agents.agent.invalid.url.regex= \
^((?!(|/\.\|\.|/|*|\.\info|%25|%2B|%2C|%[0-1][0-9a-fA-F]|%[7-9a-fA-F][0-9a-fA-F])).)$
```

Ignore Server Check Properties

Ignore Server Check

When enabled, do not check whether AM is up before doing a 302 redirect.

Property: `com.sun.identity.agents.config.ignore.server.check`

Ignore Path Info Properties

Ignore Path Info in Request URL

When enabled, strip path info from the request URL while doing the Not Enforced List check, and URL policy evaluation. This is designed to prevent a user from accessing a URI by appending the matching pattern in the policy or not enforced list.

For example, if the not enforced list includes `http://host/*.gif`, then stripping path info from the request URI prevents access to `http://host/index.html` by using `http://host/index.html?hack.gif`.

However, when a web server is configured as a reverse proxy for a J2EE application server, the path info is interpreted to map a resource on the proxy server rather than the application server. This prevents the not enforced list or the policy from being applied to the part of the URI below the application server path if a wildcard character is used.

For example, if the not enforced list includes `http://host/webapp/servletcontext/*` and the request URL is `http://host/webapp/servletcontext/example.jsp`, the path info is `/servletcontext/example.jsp` and the resulting request URL with path info stripped is `http://host/webapp/`, which does not match the not enforced list. Thus when this property is enabled, path info is not stripped from the request URL even if there is a wildcard in the not enforced list or policy.

Make sure therefore when this property is enabled that there is nothing following the wildcard in the not enforced list or policy.

Note

The NGINX web policy agent does not support this setting.

Property: `com.sun.identity.agents.config.ignore.path.info`

Multi-Byte Enable Properties

Native Encoding of Profile Attributes

When enabled, the agent encodes the LDAP header values in the default encoding of operating system locale. When disabled, the agent uses UTF-8.

Property: `com.sun.identity.agents.config.convert.mbyte.enable`

Goto Parameter Name Properties

Goto Parameter Name

Property used only when CDSO is enabled. Only change the default `goto` value when the login URL has a landing page specified, such as `com.sun.identity.config.cdsso.cdcervlet.url = http://openam.example.com:8080/openam/cdcervlet?goto= http://www.example.com/landing.jsp`. The agent uses this parameter to append the original request URL to this cdcervlet URL. The landing page consumes this parameter to redirect to the original URL.

As an example, if you set this value to `goto2`, then the complete URL sent for authentication is `http://openam.example.com:8080/openam/cdcervlet?goto= http://www.example.com/landing.jsp?goto2=http://www.example.com/original.jsp`.

Property: `com.sun.identity.config.redirect.param`

Deprecated Agent Properties

Anonymous User Default Value

User ID of unauthenticated users. Default: `anonymous`.

Property: `com.sun.identity.config.anonymous.user.id`

8.1.6. Configuring Web Policy Agent Advanced Properties

This section covers advanced web agent properties. After creating the agent profile, you access these properties in the AM console under Realms > *Realm Name* > Applications > Agents > Web > *Agent Name* > Advanced.

This section describes the following property groups:

- Client Identification Properties
- Load Balancer Properties
- Post Data Preservation Properties
- Sun Java System Proxy Server Properties
- Microsoft IIS Server Properties
- IBM Lotus Domino Server Properties
- Custom Properties

Client Identification Properties

If the agent is behind a proxy or load balancer, then the agent can get client IP and host name values from the proxy or load balancer. For proxies and load balancer that support providing the client IP and host name in HTTP headers, you can use the following properties.

When multiple proxies or load balancers sit in the request path, the header values can include a comma-separated list of values with the first value representing the client, as in `client,next-proxy,first-proxy`.

Client IP Address Header

HTTP header name that holds the IP address of the client.

Property: `com.sun.identity.agents.config.client.ip.header`

Client Hostname Header

HTTP header name that holds the hostname of the client.

Property: `com.sun.identity.agents.config.client.hostname.header`

Load Balancer Properties

Load Balancer Setup

Enable if a load balancer is used for AM services.

Property: `com.sun.identity.agents.config.load.balancer.enable`

Hot swap: no

Override Request URL Protocol

Enable if the agent is sitting behind a SSL/TLS off-loader, load balancer, or proxy such that the protocol users use is different from the protocol the agent uses. When enabled, the protocol is overridden with the value from the Agent Deployment URI Prefix (property: `com.sun.identity.agents.config.agenturi.prefix`).

Property: `com.sun.identity.agents.config.override.protocol`

Override Request URL Host

Enable if the agent is sitting behind a SSL/TLS off-loader, load balancer, or proxy such that the host name users use is different from the host name the agent uses. When enabled, the host is overridden with the value from the Agent Deployment URI Prefix (property: `com.sun.identity.agents.config.agenturi.prefix`).

Property: `com.sun.identity.agents.config.override.host`

Override Request URL Port

Enable if the agent is sitting behind a SSL/TLS off-loader, load balancer, or proxy such that the port users use is different from the port the agent uses. When enabled, the port is overridden with the value from the Agent Deployment URI Prefix (property: `com.sun.identity.agents.config.agenturi.prefix`).

Property: `com.sun.identity.agents.config.override.port`

Override Notification URL

Enable if the agent is sitting behind a SSL/TLS off-loader, load balancer, or proxy such that the URL users use is different from the URL the agent uses. When enabled, the URL is overridden with the value from the Agent Deployment URI Prefix (property: `com.sun.identity.agents.config.agenturi.prefix`).

Property: `com.sun.identity.agents.config.override.notification.url`

`com.sun.identity.agents.config.postdata.preserve.stickysession.mode` (Not yet in the AM console)

Specifies whether to create a cookie, or to append a query string to the URL to assist with sticky load balancing.

`com.sun.identity.agents.config.postdata.preserve.stickysession.value` (Not yet in the AM console)

Specifies the key-value pair for stickysession mode. For example, a setting of `lb=myserver` either sets an `lb` cookie with `myserver` value, or adds `lb=myserver` to the URL query string.

Post Data Preservation Properties

POST Data Preservation

Enables HTTP POST data preservation. This feature is available in the Apache 2.2, Microsoft IIS 6, Microsoft IIS 7, and Sun Java System Web Server web policy agents as of version 3.0.3.

Property: `com.sun.identity.agents.config.postdata.preserve.enable`

POST Data Entries Cache Period

POST cache entry lifetime in minutes. Default: 10.

Property: `com.sun.identity.agents.config.postcache.entry.lifetime`

POST Data Preservation Cookie Name (Not yet in the AM console)

When HTTP POST data preservation is enabled, override properties are set to true, and the agent is behind a load balancer, then this property sets the name and value of the sticky cookie to use.

Property: `com.sun.identity.agents.config.postdata.preserve.lbcookie`

`org.forgerock.agents.config.postdata.preserve.dir` (Not yet in the AM console)

The directory on the agent server where preserved post data will be written while authorization is requested from AM.

Default: `/web_agents/agent_version/log`

Post Data Preservation URI Prefix (Not yet in the AM console)

If you run multiple web servers with policy agents behind a load balancer that directs traffic based on the request URI, and you need to preserve POST data, then set this property.

By default, policy agents use a dummy URL for POST data preservation, `http://agent.host:port/dummypost/sunpostpreserve`, to handle POST data across redirects to and from AM. When you set this property, the policy agent prefixes the property value to the dummy URL path. In other words, when you set `com.forgerock.agents.config.pdpuri.prefix = appl`, the policy agent uses the dummy URL, `http://agent.host:port/appl/dummypost/sunpostpreserve`.

Next, use the prefix you set when you define load balancer URI rules. This ensures that clients end up being redirected to the policy agent that preserved the POST data.

Property: `com.forgerock.agents.config.pdpuri.prefix`

org.forgerock.agents.pdp.javascript.repost (Not yet in the AM console)

When set to `true`, preserved post data will be resubmitted to the destination server after authentication by using JavaScript.

Sun Java System Proxy Server Properties

Override Proxy Server's Host and Port

When enabled ignore the host and port settings.

Property: `com.sun.identity.agents.config.proxy.override.host.port`

Hot swap: no

Microsoft IIS Server Properties

Authentication Type

The agent should normally perform authentication, so this is not required. If necessary, set to `none`.

Property: `com.sun.identity.agents.config.iis.auth.type`

Hot swap: no

Replay Password Key

DES key for decrypting the basic authentication password in the session.

Property: `com.sun.identity.agents.config.replaypasswd.key`

Filter Priority

The loading priority of filter, DEFAULT, HIGH, LOW, or MEDIUM.

Property: `com.sun.identity.agents.config.iis.filter.priority`

Filter configured with OWA

Enable if the IIS agent filter is configured for OWA.

Property: `com.sun.identity.agents.config.iis.owa.enable`

Change URL Protocol to HTTPS

Enable to avoid IE6 security pop-ups.

Property: `com.sun.identity.agents.config.iis.owa.enable.change.protocol`

Idle Session Timeout Page URL

This property is no longer used.

Property: `com.sun.identity.agents.config.iis.owa.enable.session.timeout.url`

Show Password in HTTP Header

Set to `true` if encrypted password should be set in HTTP header `AUTH_PASSWORD`.

Property: `com.sun.identity.agents.config.iis.password.header`

Logon and Impersonation

Set to `true` if agent should do Windows Logon and User Impersonation.

Property: `com.sun.identity.agents.config.iis.logonuser`

IBM Lotus Domino Server Properties

Check User in Domino Database

When enabled, the agent checks whether the user exists in the Domino name database.

Property: `com.sun.identity.agents.config.domino.check.name.database`

Use LTPA token

Enable if the agent needs to use LTPA Token.

Property: `com.sun.identity.agents.config.domino.ltpa.enable`

LTPA Token Cookie Name

The name of the cookie that contains the LTPA token.

Property: `com.sun.identity.agents.config.domino.ltpa.cookie.name`

LTPA Token Configuration Name

The configuration name that the agent uses in order to employ the LTPA token mechanism.

Property: `com.sun.identity.agents.config.domino.ltpa.config.name`

LTPA Token Organization Name

The organization name to which the LTPA token belongs.

Property: `com.sun.identity.agents.config.domino.ltpa.org.name`

Custom Properties

Custom Properties

Additional properties to augment the set of properties supported by agentd. Such properties take the following forms.

- `customproperty=custom-value1`
- `customlist[0]=customlist-value-0`
- `customlist[1]=customlist-value-1`
- `custommap[key1]=custommap-value-1`
- `custommap[key2]=custommap-value-2`

Property: `com.sun.identity.agents.config.freeformproperties`

8.1.7. Configuring Web Policy Agent Custom Properties

This section covers custom web agent properties.

Note

These settings do not appear as configurable options in the AM console, so must be added as custom properties, or set in the local configuration file.

If using a centralized configuration, you create these properties in the AM console under Realms > *Realm Name* > Applications > Agents > Web > *Agent Name* > Advanced > Custom Properties.

This section describes the following property groups:

- Bootstrap Properties
- Encryption Properties
- Naming URL and Failover Properties
- JSON-Formatted Response Properties
- Miscellaneous Custom Properties

Bootstrap Properties

These properties are only used within the local configuration file. They are not available in the AM console. The agent uses these bootstrap properties to connect to AM.

com.sun.identity.agents.config.organization.name

The AM realm where the agent profile is located.

Default: /

com.sun.identity.agents.config.username

The name of the agent profile in AM.

com.sun.identity.agents.config.password

The password required by the agent profile, encrypted with the key specified in `com.sun.identity.agents.config.key`.

com.sun.identity.agents.config.key

The encryption key used to encrypt the agent profile password, which should be provided in `com.sun.identity.agents.config.password`.

org.forgerock.agents.config.tls

Set this property to a list of protocols to support. The list consists of one or more protocol strings separated by colons. For example `TLSv1.2:TLSv1.1:TLSv1`.

org.forgerock.agents.init.retry.max

This is the maximum number of consecutive agent initialization retries.

The default value is 0 (not set).

org.forgerock.agents.init.retry.wait

This is the wait time in seconds between retries.

The default value is 0 (not set).

com.sun.identity.agents.config.connect.timeout

Set this property to the number of seconds to keep the socket connection open before timing out. Applies to both TCP *connect* and *receive* operations.

Default: 4 (seconds)

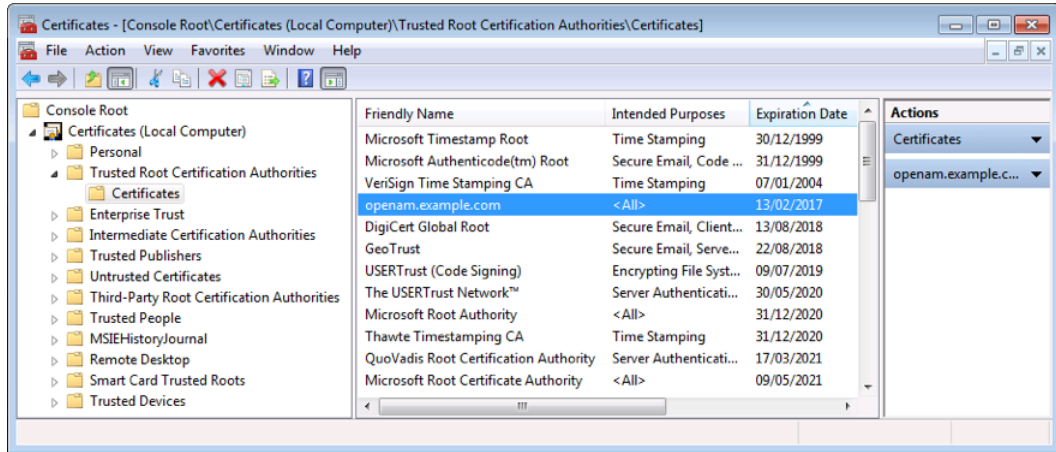

Encryption Properties

com.forgerock.agents.config.cert.ca.file

Set this property to the file name that contains one or more CA certificates. The file should be *Privacy Enhanced Mail* (PEM) encoded. AM requires PEM files to be base64-encoded ASCII data.

When using the Windows built-in Secure Channel API, set this property to the friendly name of the CA certificate file as it appears in the certificates snap-in. For example, the friendly name of the imported CA certificate in the image below is `openam.example.com`.

Figure 8.1. CA Friendly Name in the Windows Certificates Snap-in

You must set this property if `com.sun.identity.agents.config.trust.server.certs` is set to `false`.

`com.forgerock.agents.config.cert.file`

When AM is configured to perform client authentication, set this property to the name of the file that contains the public PEM-encoded client certificate that corresponds with the private key specified in `com.forgerock.agents.config.cert.key`.

When using the Windows built-in Secure Channel API, you can set this property to either the friendly name of the certificate file as it appears in the certificates snap-in, or the name of the file containing the client certificate in PKCS#12/PFX format.

To use a client certificate file in PKCS#12/PFX format:

1. Obtain your client certificate, ensuring the signing chain is intact, and that the key and CA certificate are included.
2. Run the **agentadmin** tool to generate an encrypted password for the certificate file:

```
C:\> cd web_agents\iis_agent\bin
C:\path\to\web_agents\iis_agent\bin> agentadmin.exe -p "Encryption Key" "Certificate File Password"

Encrypted password value: zck+6RKqjtc=
```

The value used for *Encryption Key* comes from the `com.sun.identity.agents.config.key` property. The value of *Certificate File Password* should be the password required to access the client certificate file.

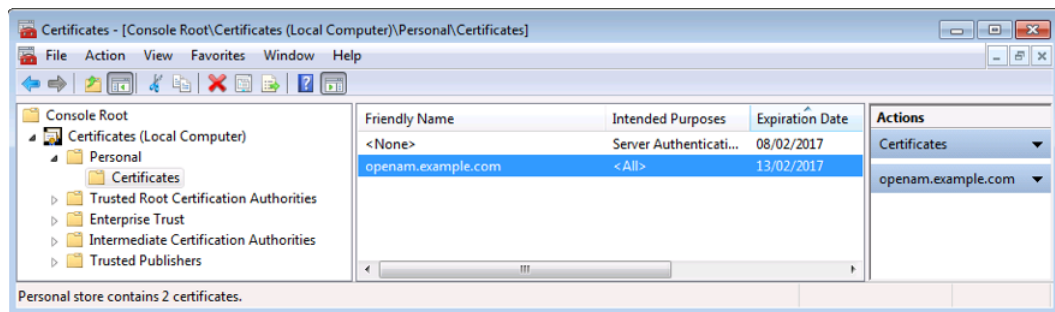

- Use the encrypted password value in the agent configuration file as follows:

```
com.forgerock.agents.config.cert.file=C:\Certificates\myClientCertificate.pfx
com.forgerock.agents.config.cert.key=
com.forgerock.agents.config.cert.key.password=zck+6RKqjtc=
com.sun.identity.agents.config.trust.server.certs=false
```

- Restart the agent.

If you do not want to use a file directly, enter the friendly name of the certificate as the value of the `com.forgerock.agents.config.cert.file` property instead. As an example, the friendly name of the imported certificate in the image below is `openam.example.com`.

Figure 8.2. Friendly Name in the Windows Certificates Snap-in

`com.forgerock.agents.config.cert.key`

Set this property to the name of the file that contains the private key. On UNIX systems, that key should be encoded in PEM format.

On Windows systems, that entry depends. If SSL mutual authentication is required with AM, that entry should contain the name of the private key or certificate imported in the Windows Certificate Manager, part of the Microsoft Management Console. For a web server, that should point to the Local Machine or Service certificate store, depending on the account associated with the Web server.

`com.forgerock.agents.config.cert.key.password`

Set this property to the obfuscated private key password. Obfuscate the password by using **agentadmin --p**, as demonstrated in the following example to generate the value:

```
$ cd /web_agents/agent-type/bin
$ ./agentadmin --p "key" "password"
```

Here, `agent-type` corresponds to the file system directory for the particular agent type, such as `apache24_agent`, `password` is the private key password, and `key` is the obfuscation key as specified by `com.sun.identity.agents.config.key`.

Tip

You can generate a new obfuscation key by using `agentadmin --k`.

This property is not used on Microsoft Windows systems.

`com.forgerock.agents.config.ciphers`

Set this property to a list of ciphers to support. The list consists of one or more cipher strings separated by colons, as defined in the man page for `ciphers` available at <http://www.openssl.org/docs/apps/ciphers.html>.

Default: `HIGH:MEDIUM`.

`com.sun.identity.agents.config.trust.server.certs`

When SSL is configured, set to `false` to trust the AM SSL certificate only if the certificate is found to be correct and valid. Default is `true` to make it easy to try SSL during evaluation.

Important

The default setting, `true`, means that the web policy agent trusts all server certificates. Change this to `false`, and test that your web policy agent can trust server certificates before deploying the policy agent in production.

`org.forgerock.agents.config.secure.channel.disable`

On Windows operating systems, web policy agents use the built-in Secure Channel API for SSL/TLS communications.

Set this property to `true` to disable the built-in Secure Channel API and use OpenSSL instead.

To use OpenSSL you will also need to set the `AM_SSL_SCHANNEL` environment variable to `false`. See Section 8.1.8, "Configuring Web Policy Agent Environment Variables".

Naming URL and Failover Properties**`com.forgerock.agents.ext.url.validation.default.url.set`**

This property takes a comma-separated list of indexes for URL values indicating the order in which to fail over, where the indexes are taken from the values set for `com.sun.identity.agents.config.naming.url`, `com.sun.identity.agents.config.login.url`, `com.sun.identity.agents.config.cdsso.cdcervlet.url`, and `com.sun.identity.agents.config.logout.url`.

For example if `com.sun.identity.agents.config.naming.url` is set as follows:

```
com.sun.identity.agents.config.naming.url=  
http://aml.example.com:8080/openam/namingservice
```

```
http://am2.example.com:8080/openam/namingservice
```

Then the following setting means first use AM on `am1.example.com`, then fail over if necessary to AM on `am2.example.com`, assuming `com.forgerock.agents.ext.url.validation.level` is set to enable validation.

```
com.forgerock.agents.ext.url.validation.default.url.set=0,1
```

When using this failover capability make sure you synchronize URL settings in `com.sun.identity.agents.config.naming.url`, `com.sun.identity.agents.config.login.url`, `com.sun.identity.agents.config.cdssso.cdcservlet.url`, and `com.sun.identity.agents.config.logout.url` such that each service shares the same index across all properties. In other words, in the example above each service under `http://am1.example.com:8080/openam` would be the first item (index: 0) for each property. This ensures the policy agent fails over and fails back from one server to another in synchronized fashion for all services.

This property has no default setting.

`com.forgerock.agents.ext.url.validation.level`

This bootstrap configuration property lets you configure naming URL validation during the initial bootstrap phase when the policy agent reads its configuration, and then thereafter if the policy agent is configured fail over when a naming URL becomes invalid.

When URL validation is fully disabled the policy agent does not need to connect to AM during the bootstrap phase.

If you leave naming URL validation disabled, then make sure that the URLs in the policy agent bootstrap configuration file are valid and correct. As the policy agent performs no further validation after the bootstrap phase, incorrect naming URLs can cause the agent to crash.

When naming URL validation is enabled you should also ensure the `com.sun.identity.agents.config.connect.timeout` property is set to a reasonable value, such as 4 seconds, which is the default.

To enable full URL validation, set the property as shown:

```
com.forgerock.agents.ext.url.validation.level = 0
```

This property can take the following values.

0

Fully validate naming URLs specified by using the `com.sun.identity.agents.config.naming.url` property. The web policy agent logs into and logs out of AM to check that a naming URL is valid.

1

Check that naming URLs are valid by performing an HTTP GET, which should receive an HTTP 200 response.

2 (Default)

Disable all naming URL validation.

`com.forgerock.agents.ext.url.validation.ping.interval`

Set this property to the seconds between validation requests against the current naming URL.

The value of the `com.sun.identity.agents.config.connect.timeout` property must not exceed this value.

Default: 60 (seconds)

`com.forgerock.agents.ext.url.validation.ping.miss.count`

If validation requests against the current naming URL fail this number of times in a row, the web policy agent fails over to the next service in `com.forgerock.agents.ext.url.validation.default.url.set`.

Default: 3

`com.forgerock.agents.ext.url.validation.ping.ok.count`

After failover, if validation requests against the default naming URL succeed this number of times in a row, the web policy agent fails back to that service, the first URL in the `com.forgerock.agents.ext.url.validation.default.url.set` list.

Default: 3

`com.sun.identity.agents.config.naming.url`

Set this property to the naming service URL(s) used for naming lookups in AM. Separate multiple URLs with single space characters.

Forward Proxy Custom Properties

`com.sun.identity.agents.config.forward.proxy.host`

When AM and the agent communicate through a web proxy server configured in forward proxy mode, set this property to the proxy server host name.

`com.sun.identity.agents.config.forward.proxy.password`

When AM and the agent communicate through a web proxy server configured in forward proxy mode and the proxy server has the agent authenticate using Basic Authentication, set this property to the agent's password.

`com.sun.identity.agents.config.forward.proxy.port`

When AM and the agent communicate through a web proxy server configured in forward proxy mode, set this property to the proxy server port number.

`com.sun.identity.agents.config.forward.proxy.user`

When AM and the agent communicate through a web proxy server configured in forward proxy mode and the proxy server has the agent authenticate using Basic Authentication, set this property to the agent's user name.

JSON-Formatted Response Properties

`org.forgerock.agents.config.json.url[n]`

Use regular expressions to specify a list of resource URLs that should trigger JSON-formatted errors to be returned.

Example: `org.forgerock.agents.config.json.url[0]=https://www.example.com:8443/jsonClient/*`

`org.forgerock.agents.config.json.header[Header]=Value`

Specify HTTP headers and associated values that trigger JSON-formatted errors to be returned.

Example: `org.forgerock.agents.config.json.header[enableJsonResponse]=true`

`org.forgerock.agents.config.json.url.invert`

Set to `true` to invert the meaning of both the `org.forgerock.agents.config.json.url` and `org.forgerock.agents.config.json.header` properties. When inverted the specified values in those two properties will not trigger JSON-formatted responses. Any non-specified value will trigger JSON-formatted responses, instead.

Default: `false` (not set)

`org.forgerock.agents.config.json.response.code`

Specify an HTTP response code to return when a JSON-formatted error is triggered.

Example: `org.forgerock.agents.config.json.response.code=401`

Miscellaneous Custom Properties

`com.forgerock.agents.cache_control_header.enable`

Set this property to `true` to enable use of Cache-Control headers that prevent proxies from caching resources accessed by unauthenticated users. Default: `false`.

`org.forgerock.agents.config.keepalive.disable`

The web policy agents by default use a single connection and specify `Connection:Keep-alive` when logging in to AM and fetching attributes or policy decisions.

If a load-balancer or reverse-proxy is being used it may be necessary to disable the use of keep-alive, in which case set this property to `true`.

Default: `false`

`org.forgerock.agents.config.cdsso.deny.cleanup.disable`

By default, web policy agents configured for CDSO will delete SSO cookies when a page returns an HTTP 403 forbidden status code. Visiting any other protected page will require re-authentication.

To retain SSO cookies when an HTTP 403 forbidden status code is returned, set this property to `true`.

Default: `false`

`org.forgerock.agents.config.skip.post.url[n]`

Specify a list of URLs that will not be processed by the web policy agent POST data inspector. This allows other modules on the same server to access the POST data directly.

The following example uses wildcards to add a file named `postreader.jsp` in the root of any protected website to the list of URLs that will not have their POST data inspected: `org.forgerock.agents.config.skip.post.url[0]=http://*/*/postreader.jsp`

Note

Any URLs added to this property should also be added to the Not Enforced URLs (`com.sun.identity.agents.config.notenforced.url`) property. See Not Enforced URL Processing Properties.

8.1.8. Configuring Web Policy Agent Environment Variables

This section covers web agent properties that are configured by using environment variables. You must restart the container in which web policy agents are running to apply changes to these settings.

Web Policy Agent Environment Properties

`AM_DEFAULT_LOG_LEVEL`

Configures the log level of garbage collector statistics for all policy agents instances in the container. The logs are written into the `/web_agents/type/log/agent.log` file every 3 seconds.

The default value of the `AM_DEFAULT_LOG_LEVEL` variable is `Error`. Increase it to `Message` or `All` for fine-grained detail.

Valid values for the variable are:

- All
- Error

- Info
- Message
- Warning

AM_MAX_SHARED_POOL_SIZE

Configure the maximum amount of shared memory, in bytes, that the web policy agents use for caching. The maximum size the cache can grow to is approximately 2 gigabytes (exactly 0x7FFF000 bytes).

You can reduce the maximum size by setting `AM_MAX_SHARED_POOL_SIZE`, specified in bytes. You should not reduce the cache size to less than 10 megabytes. You cannot increase the default maximum cache size.

Warning

Reducing the size of the cache may affect web policy agent performance under heavy workloads, such as handling thousands of concurrent sessions.

AM_SSL_SCHANNEL

Web policy agents installed on Windows operating systems use the built-in Secure Channel API by default for SSL/TLS communications.

To use OpenSSL on a Windows system, set this environment property to `false`.

8.2. Configuring Agent Authenticators

An *agent authenticator* has read-only access to multiple agent profiles defined in the same realm, typically allowing an agent to read web service agent profiles.

After creating the agent profile, you access agent properties in the AM console under Realms > *Realm Name* > Applications > Agents > Agent Authenticator > *Agent Name*.

Password

Specifies the password the agent uses to connect to AM.

Status

Specifies whether the agent profile is active, and so can be used.

Agent Profiles allowed to Read

Specifies which agent profiles in the realm the agent authenticator can read.

Agent Root URL for CDSSO

Specifies the list of agent root URLs for CDSSO. The valid value is in the format *protocol://hostname:port/* where *protocol* represents the protocol used, such as *http* or *https*, *hostname* represents the host name of the system where the agent resides, and *port* represents the port number on which the agent is installed. The slash following the port number is required.

If your agent system also has virtual host names, add URLs with the virtual host names to this list as well. AM checks that *goto* URLs match one of the agent root URLs for CDSSO.

Command-Line Tool Reference

Table of Contents

agentadmin	101
------------------	-----

Name

agentadmin — manage web policy agent installation

Synopsis

agentadmin {options}

Description

This command manages web policy agent installations.

Options

The following options are supported:

--i

Perform an interactive install of a new agent instance.

Usage: **agentadmin --i**

For more information, see:

- Section 3.3, "Installing Apache Web Policy Agents"
- Section 4.3, "Installing IIS Web Policy Agents"

--s

Perform a silent, non-interactive install of a new agent instance.

Usage: **agentadmin --s** *web-server-config-file* *openam-url* *agent-url* *realm* *agent-profile-name* *agent-profile-password* [**--changeOwner**] [**--acceptLicense**] [**--forceInstall**]

web-server-config-file

When installing in Apache HTTP Server, enter the full path to the Apache HTTP server configuration file. The installer modifies this file to include the web policy agent configuration and module.

When installing in Microsoft IIS, enter the ID number of the IIS site in which to install the web policy agent. To list the available sites in an IIS server and the relevant ID numbers, run **agentadmin.exe --n**.

openam-url

Enter the full URL of the AM instance that the web policy agents will use. Ensure the deployment URI is specified.

Example:

`https://openam.example.com:8443/openam`

agent-url

Enter the full URL of the server on which the agent is running.

Example:

`http://www.example.com:80`

realm

Enter the AM realm containing the agent profile.

agent-profile-name

Enter the name of the agent profile in AM.

agent-profile-password

Enter the full path to the agent profile password file.

--changeOwner

Use this option to change the ownership of the created directories to be the same user and group as specified in the Apache HTTP Server configuration, or the user that is running the selected IIS site.

--acceptLicense

When you run certain commands, you will be prompted to read and accept the software license agreement. You can suppress the license agreement prompt by including the optional `--acceptLicense` parameter. Specifying this options indicates that you have read and accepted the terms stated in the license.

To view the license agreement, open `/path/to/web_agents/agent_type/legal/Forgerock_License.txt`.

--forceInstall

Add this option to proceed with a silent installation even if it cannot connect to the specified AM server during installation, rather than exiting.

For more information, see:

- Section 3.5, "Installing Apache Web Policy Agents Silently"
- Section 4.4, "Installing IIS Web Policy Agents Silently"

--n

List the sites available in an IIS server.

Example:

```
c:\web_agents\iis_agent\bin> agentadmin.exe --n

IIS Server Site configuration:

Number of Sites: 2

id: 1    name: "DEFAULT WEB SITE"
id: 2    name: "CUSTOMERPORTAL"
```

--l

List existing configured agent instances.

Usage: **agentadmin --l**

Example:

```
$ ./agentadmin --l
OpenAM Web Agent configuration instances:

id:          agent_1
configuration: /opt/web_agents/apache24_agent/bin/../instances/agent_1
server/site:  /etc/httpd/conf/httpd.conf

id:          agent_2
configuration: /opt/web_agents/apache24_agent/bin/../instances/agent_2
server/site:  /etc/httpd/conf/httpd.conf

id:          agent_3
configuration: /opt/web_agents/apache24_agent/bin/../instances/agent_3
server/site:  /etc/httpd/conf/httpd.conf
```

--r

Remove an existing agent instance.

Usage: **agentadmin --r agent-instance**

agent-instance

The ID of the web policy agent configuration instance to remove.

Respond **yes** when prompted to confirm removal.

For more information, see:

- Section 3.6, "Removing Apache Web Policy Agents"
- Section 4.5, "Managing IIS Web Policy Agents"

--k

Generate a new signing key.

Usage: **agentadmin --k**

Examples:

- UNIX:

```
$ cd /web_agents/apache24_agent/bin/
$ ./agentadmin --k
Encryption key value: YWM00ThlMTQtMzMxOS05Nw==
```

- Windows:

```
C:\> cd web_agents\apache24_agent\bin
C:\web_agents\apache24_agent\bin> agentadmin --k
Encryption key value: YWM00ThlMTQtMzMxOS05Nw==
```

For more information, see [Encryption Properties](#).

--p

Use a generated encryption key to encrypt a new password.

Usage: **agentadmin --p *encryption-key password***

encryption-key

An encryption key, generated by the **agentadmin --k** command.

password

The password to encrypt.

Examples:

- UNIX:

```
$ ./agentadmin --p "YWM00ThlMTQtMzMxOS05Nw==" "newpassword"
Encrypted password value: 07bJ0SeM/G8yd04=
```

- Windows:

```
C:\web_agents\apache24_agent\bin> agentadmin --p "YWM00ThlMTQtMzMxOS05Nw==" "newpassword"
Encrypted password value: 07bJ0SeM/G8yd04=
```

For more information, see [Encryption Properties](#).

--v

Display information about **agentadmin** build and version numbers, and available system resources.

For example:

```
OpenAM Web Agent for IIS Server 7.5, 8.x
Version: 4.1
Revision: 5ba1ld2
Build machine: WIN-6R2CH15R77
Build date: Nov  8 2016 11:30:18
```

```
System Resources:
total memory size: 7.7GB
pre-allocated session/policy cache size: 1.0GB
log buffer size: 128.5MB
min audit log buffer size: 2MB, max 2.0GB
total disk size: 162.4GB
free disk space size: 89.6GB
```

```
System contains sufficient resources (with remote audit log feature enabled).
```

Return Codes

The **agentadmin** command returns **EXIT_SUCCESS** when an operation has completed successfully, and **EXIT_FAILURE** if the operation failed to complete.

The numerical return value will depend on the operating system in use, but is generally 0 for **EXIT_SUCCESS** and greater than zero for **EXIT_FAILURE**.

Appendix A. Getting Support

For more information or resources about AM and ForgeRock Support, see the following sections:

A.1. Accessing Documentation Online

ForgeRock publishes comprehensive documentation online:

- The [ForgeRock Knowledge Base](#) offers a large and increasing number of up-to-date, practical articles that help you deploy and manage ForgeRock software.

While many articles are visible to community members, ForgeRock customers have access to much more, including advanced information for customers using ForgeRock software in a mission-critical capacity.

- ForgeRock product documentation, such as this document, aims to be technically accurate and complete with respect to the software documented. It is visible to everyone and covers all product features and examples of how to use them.

A.2. Joining the ForgeRock Community

Visit the [Community resource center](#) where you can find information about each project, browse the resource catalog, ask and answer questions on the forums, find community events near you, and find the source code for open source software.

A.3. Getting Support and Contacting ForgeRock

ForgeRock provides support services, professional services, classes through ForgeRock University, and partner services to assist you in setting up and maintaining your deployments. For a general overview of these services, see <https://www.forgerock.com>.

ForgeRock has staff members around the globe who support our international customers and partners. For details, visit <https://www.forgerock.com>, or send an email to ForgeRock at info@forgerock.com.

Glossary

Access control	Control to grant or to deny access to a resource.
Account lockout	The act of making an account temporarily or permanently inactive after successive authentication failures.
Actions	Defined as part of policies, these verbs indicate what authorized subjects can do to resources.
Advice	In the context of a policy decision denying access, a hint to the policy enforcement point about remedial action to take that could result in a decision allowing access.
Agent administrator	User having privileges only to read and write policy agent profile configuration information, typically created to delegate policy agent profile creation to the user installing a policy agent.
Agent authenticator	Entity with read-only access to multiple agent profiles defined in the same realm; allows an agent to read web service profiles.
Application	<p>In general terms, a service exposing protected resources.</p> <p>In the context of AM policies, the application is a template that constrains the policies that govern access to protected resources. An application can have zero or more policies.</p>
Application type	<p>Application types act as templates for creating policy applications.</p> <p>Application types define a preset list of actions and functional logic, such as policy lookup and resource comparator logic.</p>

	Application types also define the internal normalization, indexing logic, and comparator logic for applications.
Attribute-based access control (ABAC)	Access control that is based on attributes of a user, such as how old a user is or whether the user is a paying customer.
Authentication	The act of confirming the identity of a principal.
Authentication chaining	A series of authentication modules configured together which a principal must negotiate as configured in order to authenticate successfully.
Authentication level	Positive integer associated with an authentication module, usually used to require success with more stringent authentication measures when requesting resources requiring special protection.
Authentication module	AM authentication unit that handles one way of obtaining and verifying credentials.
Authorization	The act of determining whether to grant or to deny a principal access to a resource.
Authorization Server	In OAuth 2.0, issues access tokens to the client after authenticating a resource owner and confirming that the owner authorizes the client to access the protected resource. AM can play this role in the OAuth 2.0 authorization framework.
Auto-federation	Arrangement to federate a principal's identity automatically based on a common attribute value shared across the principal's profiles at different providers.
Bulk federation	Batch job permanently federating user profiles between a service provider and an identity provider based on a list of matched user identifiers that exist on both providers.
Circle of trust	Group of providers, including at least one identity provider, who have agreed to trust each other to participate in a SAML v2.0 provider federation.
Client	In OAuth 2.0, requests protected web resources on behalf of the resource owner given the owner's authorization. AM can play this role in the OAuth 2.0 authorization framework.
Conditions	Defined as part of policies, these determine the circumstances under which which a policy applies. Environmental conditions reflect circumstances like the client IP address, time of day, how the subject authenticated, or the authentication level achieved.

	Subject conditions reflect characteristics of the subject like whether the subject authenticated, the identity of the subject, or claims in the subject's JWT.
Configuration datastore	LDAP directory service holding AM configuration data.
Cross-domain single sign-on (CDSSO)	AM capability allowing single sign-on across different DNS domains.
Delegation	Granting users administrative privileges with AM.
Entitlement	Decision that defines which resource names can and cannot be accessed for a given subject in the context of a particular application, which actions are allowed and which are denied, and any related advice and attributes.
Extended metadata	Federation configuration information specific to AM.
Extensible Access Control Markup Language (XACML)	Standard, XML-based access control policy language, including a processing model for making authorization decisions based on policies.
Federation	Standardized means for aggregating identities, sharing authentication and authorization data information between trusted providers, and allowing principals to access services across different providers without authenticating repeatedly.
Fedlet	Service provider application capable of participating in a circle of trust and allowing federation without installing all of AM on the service provider side; AM lets you create Java Fedlets.
Hot swappable	Refers to configuration properties for which changes can take effect without restarting the container where AM runs.
Identity	Set of data that uniquely describes a person or a thing such as a device or an application.
Identity federation	Linking of a principal's identity across multiple providers.
Identity provider (IdP)	Entity that produces assertions about a principal (such as how and when a principal authenticated, or that the principal's profile has a specified attribute value).
Identity repository	Data store holding user profiles and group information; different identity repositories can be defined for different realms.
Java EE policy agent	Java web application installed in a web container that acts as a policy agent, filtering requests to other applications in the container with policies based on application resource URLs.

Metadata	Federation configuration information for a provider.
Policy	Set of rules that define who is granted access to a protected resource when, how, and under what conditions.
Policy Agent	Agent that intercepts requests for resources, directs principals to AM for authentication, and enforces policy decisions from AM.
Policy Administration Point (PAP)	Entity that manages and stores policy definitions.
Policy Decision Point (PDP)	Entity that evaluates access rights and then issues authorization decisions.
Policy Enforcement Point (PEP)	Entity that intercepts a request for a resource and then enforces policy decisions from a PDP.
Policy Information Point (PIP)	Entity that provides extra information, such as user profile attributes that a PDP needs in order to make a decision.
Principal	<p>Represents an entity that has been authenticated (such as a user, a device, or an application), and thus is distinguished from other entities.</p> <p>When a Subject successfully authenticates, AM associates the Subject with the Principal.</p>
Privilege	In the context of delegated administration, a set of administrative tasks that can be performed by specified subjects in a given realm.
Provider federation	Agreement among providers to participate in a circle of trust.
Realm	<p>AM unit for organizing configuration and identity information.</p> <p>Realms can be used for example when different parts of an organization have different applications and user data stores, and when different organizations use the same AM deployment.</p> <p>Administrators can delegate realm administration. The administrator assigns administrative privileges to users, allowing them to perform administrative tasks within the realm.</p>
Resource	<p>Something a user can access over the network such as a web page.</p> <p>Defined as part of policies, these can include wildcards in order to match multiple actual resources.</p>
Resource owner	In OAuth 2.0, entity who can authorize access to protected web resources, such as an end user.

Resource server	In OAuth 2.0, server hosting protected web resources, capable of handling access tokens to respond to requests for such resources.
Response attributes	Defined as part of policies, these allow AM to return additional information in the form of "attributes" with the response to a policy decision.
Role based access control (RBAC)	Access control that is based on whether a user has been granted a set of permissions (a role).
Security Assertion Markup Language (SAML)	Standard, XML-based language for exchanging authentication and authorization data between identity providers and service providers.
Service provider (SP)	Entity that consumes assertions about a principal (and provides a service that the principal is trying to access).
Session	The interval that starts with the user authenticating through AM and ends when the user logs out, or when their session is terminated. For browser-based clients, AM manages user sessions across one or more applications by setting a session cookie. See also Stateful session and Stateless session .
Session high availability	Capability that lets any AM server in a clustered deployment access shared, persistent information about users' sessions from the CTS token store. The user does not need to log in again unless the entire deployment goes down.
Session token	Unique identifier issued by AM after successful authentication. For a Stateful session , the session token is used to track a principal's session.
Single log out (SLO)	Capability allowing a principal to end a session once, thereby ending her session across multiple applications.
Single sign-on (SSO)	Capability allowing a principal to authenticate once and gain access to multiple applications without authenticating again.
Site	<p>Group of AM servers configured the same way, accessed through a load balancer layer.</p> <p>The load balancer handles failover to provide service-level availability. Use sticky load balancing based on <code>amlbcookie</code> values to improve site performance.</p> <p>The load balancer can also be used to protect AM services.</p>
Standard metadata	Standard federation configuration information that you can share with other access management software.
Stateful session	An AM session that resides in the Core Token Service's token store. Stateful sessions might also be cached in memory on one or more

AM servers. AM tracks stateful sessions in order to handle events like logout and timeout, to permit session constraints, and to notify applications involved in SSO when a session ends.

Stateless session

An AM session for which state information is encoded in AM and stored on the client. The information from the session is not retained in the CTS token store. For browser-based clients, AM sets a cookie in the browser that contains the session information.

Subject

Entity that requests access to a resource

When a subject successfully authenticates, AM associates the subject with the [Principal](#) that distinguishes it from other subjects. A subject can be associated with multiple principals.

User data store

Data storage service holding principals' profiles; underlying storage can be an LDAP directory service, a relational database, or a custom [IdRepo](#) implementation.

Web policy agent

Native library installed in a web server that acts as a policy agent with policies based on web page URLs.
